The actual Open Box product may differ in packaging and included accessories, but has been tested to ensure basic functionality. Also, the MoBo looks very nice and I was building a gaming PC with an Aspire SuperAlien so I wanted it to match. Everything worked perfectly except for two things which I will get to after I explain this I attached one of everything to this board, PCI, IDE, SATA, AGP, EVERYTHING. No problems at all. Ok the bad side I am new to SATA and RAID so I was not sure

how to configure it right off hand but the software and Drivers seem to help out a lot and windows is able to pick it up quite easily. I took me a while, but I figured it out. Secondly and more frustrating was the downed clock speed that shows up this was mentioned on another review on startup and what windows tells you. I don't know much about over clocking either so when I tried to OC it to the correct speed the computer would freeze up and shut down the video feed. I did not notice a speed change when I turned off the OC so I left it at its basic settings and have not had any problems since then. I like this motherboard and would probably buy it again unless I want to overclock. Both these problems were because of my own ignorance with building computers so I give it 5 stars. I bought one from Newegg over a year ago for a computer I built for a family member. It gets daily usage basic stuff no gaming and has been rock solid. Otherwise awesome product! This one works perfectly and I've upgraded to a Samsung SATA drive. Getting the drivers loaded was a little iffy, but I managed. Seems noticeably faster than the IDE times. XP Pro loaded in 14 minutes. Firewire onboard works fine, also. Great motherboard, highly suggested! Click here for more details. Secure shopping made faster. Check out with PayPal. They offer a one to three year depending on the model manufacturer's Limited warranty. If you are experiencing difficulties in warranty service through your dealer, Gigabyte may attempt to resolve this issue. This is understandable, as the cost of RMAs, facilities, employees, etc. This is a vast improvement over Gigabyte's past tech support record and nicely compliments Gigabyte's quick response time from our last examination. Though Gigabyte's RMA

policy is still only adequate, our last couple of experiences with Gigabyte's tech support response times have been excellent. Let's hope this is the beginning of a permanent trend, and that other top tier motherboard makers, such as ASUS and MSI, start to develop some consistency. Face it, VIA or Nforce you're gonna have issues with your SBlive. Man, if they didn't have the best gaming sound card it'd drop creative products in a heartbeat. Never again VIA!, nVidia did a better first try with the nforce1 than VIA with the 3tr KT chipset. Ever since I checked their developers white pages on my KT133 chipset and found out it has over 200 pages of Errata.

My next system will be either an nForce 2 system or a Operton system. Good rather unbiased review, except that I don't really agree that the KT600 is a value board. I mean computer shops will probably sell the KT600 with the cheapest video card you can get and the end consumer would have been WAY better off having a GeForce4mx built in. I mean at least you can taste even the latest games with GeForce4, which is really important. Secondly I can't express how disgusted I am in the MB makers that wreck the Nforce2's reputation for good sound via the MCPT sound storm technology by putting these crap Realtek chips in front of them and ruining the sound quality of the nforce2 MBs, as far as I am concerned this should almost be illegal! Nvidia for example, discourages the practice, which is why you won't find a SoundStorm board that uses it, even if most are using the 655 codec. I don't care if one size fits all, I just want to run the package for the product and have it remove the old and install the new and get it right. I'll never waste my time fooling around with their stuff until I've heard that's been fixed.
