Manual steering is a pretty common swap on modified Hondas because many think it has a better weight and feel to it.

If you're planning an engine swap, a manual steering conversion makes even more sense, since you don't have to attach a power steering pump, run a belt to it, and run hydraulic power steering lines to the rack and pinion. The minimal amount of weight reduction is a bonus as well. This is the worst of both worlds; you still have the weight and parasitic power loss of a power steering system, without any of the benefits thereof. The power steering rack is also geared differently than the manual rack, so steering weight will be even heavier than a regular manual steering rack and there's no guarantee the steering feel or response would actually improve; there's really no benefit to taking the easy way out like that. Doing it the correct way with a manual steering rack available here is a little more involved. Because there's no fluid running through it, the body of the manual steering rack is narrower than the power rack, so the mounting points opposite from the pinion tower are a little different. There are three ways to overcome this This is illadvised because the two bushings stacked on top of each other will, at minimum, make a lot of noise. The more likely problem is that they will flex too much, which can lead to the steering binding up. This works, but you still have to order a manual steering rack mount bushing, so if you're going to do that, you might as well It just so happens to fit perfectly over the steering rack, and the bolt holes are elongated to allow for the sway bar to flex, so if you use washers this will allow you to use the bolt holes on the power steering subframe. The stock steering shaft will connect to the input shaft of the manual steering rack, and the input shaft ends at the right place as well. However, because the hydraulic component is missing, the pinion tower itself is shorter, leaving more of the input shaft exposed.

This is an OEM Honda part that you might be able to find at a junkyard but might also have to order from a Honda dealership. Without the spacer, the floor panel that the steering shaft goes through

will not remain in place, which means water or road debris would get into your footwell. You should still replace the outer tie rod ends any time you replace the steering rack anyway; it's the same amount of labor, and the tie rod ends are a wear item that need to be replaced as part of general maintenance this goes for any car where the steering rack is being replaced, not just conversions like this. If you're more of a visual learner, there's also a very helpful video tutorial available here. We carry both brand new and fully remanufactured items from quality name brands like Borgeson, Unisteer, ZF, Duralo and more, all backed by a minimum oneyear warranty sometimes longer! and USbased customer service. Our parts professionals are here and ready to help. All of our cars need this adjustment because it almost certainly hasn't been done since the warranty expired. Performing this adjustment takes the slop out of our steering racks. The only way to get to it is with a special locknut wrench made by Honda. It's a special order. Neither the locknut or the 14mm bolt are particularly tight. No torque wrench is needed since you can't get one in there anyway. Loosen the locknut and hold it while you break loose the 14mm. Then tighten the 14mm until you feel it seat inside the rack get tight. The spec is 3 ft.lbs 20 degrees which is like nothing. Then tighten the locknut. Test the steering by rolling the wheel all the way in each direction, give it a test drive, and that's it.
