SLR sales were falling in 1983 from the markets 1981 peak, and Canon chose to try greater automation to revive sales and remain competitive. The T50 had a power winder built in giving a continuous shooting rate of 1.4 frames per second, as well as an advanced autoexposure mode, although it was still a manual focus camera. Unlike those compact cameras and the higherend models in the T series, the T50 did not have power rewind, relying on a manual crank. The cameras electric systems were powered by two AA batteries in the grip, which gave enough power to shoot 75 24exposure rolls, or 50 36exposure rolls.Canons previous A series cameras used a horizontally travelling cloth shutter, while the T50 and subsequent T series models used a vertically travelling metal blade shutter which allowed for faster shutter speeds and higher flash Xsync speeds. Only a modest increase was seen in the T50; more would be available in subsequent cameras.A couple of years earlier, Konica had tried a similar approach with their FP1.This simpletouse flash used an infrared preflash to judge the distance to the subject, and only had two buttons; a power switch and a film speed setting which toggled between 100 and 400 ISO film speed.Please help improve this article by adding citations to reliable sources. Einar Longva 1.0 out of 5 stars I was in Japan at the time and was fortunately able to purchase a Canon AE1, which can do both manual and point and shoot, for roughly the same price. Also, the original bundle didn't include a lens protector, something fairly basic and cheap that should definitely be included in a beginner's bundle. In excellent quality and great for my beginning photo class. They are simple manual film cameras and are great for learning photography or just taking great photos on film. I have a few film cameras left and I like the photos better than the digital cameras produce. It is harder to get film developed now but you can find professional developers that charge low rates for a roll of film and you always have your negatives to use if more prints are desired. The continually improved designs of SLRs coupled with perfect marketing practices created astronomical retail success for Single Lens Reflex makers. To meet demand, the big Japanese camera firms continued to produce SLRs in unbelievable numbers for the duration of the decade. By the start of the 1980's, however, this feverish production had led to market saturation. Sales of SLRs began to drop precipitously in the following three years, as most photographers who wanted an SLR already owned one. It was obvious that camera makers needed to court new shooters, but new shooters were more often intimidated by the complexity of SLRs. Sales indicated that new photo hobbyists were looking ever more towards the newer and simpler to use point and shoot cameras. These point and shoot machines were stylish, user friendly, and flaunted greater automation over their SLR ancestors. By the end of 1983 the SLR camera's fall from grace was a sad reality, and camera makers all began vying for a larger slice of the growing new user market. Canon was one of the first to take the usability and automation of a point and shoot camera and adapt it into an SLR body, and in 1983 they released a camera that would be one of the simplest SLRs of all time, the Canon T50. Aesthetically the T50 is polarizing. It doesn't have the classically beautiful lines of a German rangefinder or the rugged purposefulness of countless SLRs before it. It's a mix of strange angles and odd curves, moulded from matte black polycarbonate with mustard lettering. It's a bit too large, and the handgrip looks more like a tumor than a well-sussed design element.

www.next-conseil.fr/wp-content/plugins/formcraft/file-upload/server/content/files/162727007ee532---brent-potter-s-wheel-manual.pdf

The strap lugs are out of balance and placed oddly on the front of the body, and the rest of the shell is visually barren. 1980's fetishism aside, it's a pretty ugly camera. When looking at the blank slate that makes up the top of the T50 one is immediately underwhelmed. There are nowhere near the amount of knobs, dials, and switches that photophiles expect. Beyond the shutter button and ASA dial there exists only one other dial. This sad, little knob changes the mode from Program to SelfTimer, and rotates for a Battery Check. Most conspicuously absent is any kind of shutter speed

selector. That's because the T50 has an entirely automated shutter. Because of this, it would be easy to cast the machine aside as an excessively simplified and handicapped tool; a toy camera for amateurs. Of course Canon did develop this machine for amateurs, but they also developed it to be a real SLR. This is most evidenced by Canon's decision to equip the camera with their ubiquitous FD mount, allowing the use of their full range of SLR lenses. The FD range is fairly massive and can stand against any other brand's contemporary lens range. This means that mounting an FD lens on a T50 gives the photographer some control over depth of field, one of the most important aspects of artistic photography. So while some artistic control is returned to the shooter, the T50 is in no way a fully manual camera. Think of it as a point and shoot of any focal length with impeccable image quality. Even with this limitation on creative control, the T50 is a pretty fun camera to use. It creates a kind of freedom that's difficult to find with the more "serious" machines, allowing the photographer to focus less on the science of exposure and more on producing the desired artistic effect through framing and composition. Additionally it's possible to change your exposures a bit and compensate for the locked shutter speed.

www.cxnjl.com/userfiles/files/compliance-program-guidance-manual.pdf

To trick the T50 into over or underexposing your shot, simply estimate available light and raise or lower the ISO ASA value. Through the viewfinder TTV of the Canon T50. The viewfinder, admittedly lacking in useful information, is amazingly bright and massive. The microprism and split image rangefinder focus assist makes using the manual focus only FD lenses an incredibly simple task. To the right of the image window there's an LED display showing "P" or "M" mode. "M" denotes that the aperture ring on the lens has been set to any other aperture outside of "A", for automatic. Beyond this, the only information is that when the light meter has set a shutter speed slow enough to produce image shake, the "P" blinks slowly. When the light parameters have been judged to exceed the capabilities of the camera too much or too little light for proper exposure the "P" flashes rapidly and the shutter will not release. When considering everything about the T50, it'd be natural to think it's a stinker. With its combination of bland to ugly looks, the arguably handicapped performance, and the totally sparse viewfinder, there doesn't seem to be a brightside. But oddly enough, the T50 is a remarkably fun camera. It's solidly built, and when paired with FD lenses it's capable of producing outstanding images. The rather cumbersome design actually lends itself very well to shooting, with the camera staying perfectly balanced on a strap or in the hand. The bulbous handgrip does its job better than countless more attractive machines, and the oddly angular texturing on the back facilitates perfect onehanded operation. With the T50, the moment of zen occurs when the photographer accepts the camera's limits and embraces the vision that its designers intended. With the lens set to "A" the camera slips into Program mode, and every single shot will be technically perfect. The shooter doesn't have to think about anything beyond composition, framing, and perspective.

This provides a remarkable sense of freedom, and if the T50 had been invented in the 1950's it would be regarded today as the most important camera of all time. As it was released in the 80's, it's mostly regarded as an irrelevant and obsolete machine. But this may be the wrong perspective. Yes, the T50 limits the shooter, but don't limiting forces have a way of bringing out the very best in an artist. These limits allow the shooter to concentrate on the heart of the image being created, while letting the T50 do the math. In the right hands there's no reason the T50 can't create jawdropping images. The ultimate test of any camera is whether or not it's fun to shoot. In this regard, something about the T50 just works. Whether it's the clanking shutter coupled with the abrupt and eager winding motor, the charmingly ugly looks, or the rather excellent lens choices, something about the T50 makes one want to keep shooting. For that kind of money it's worth adding another quirky gem of a camera to the collection, and getting some excellent photos out of the deal isn't half bad either. Want your own Canon T50. By purchasing anything using these links, Casual Photophile may receive

a small commission at no additional charge to you. This helps Casual Photophile produce the content we produce. He's spent years researching, collecting, and shooting classic and collectible cameras. I did manage a few. If my life weren't so crazy right now, I'd insist that you let me come on board for guest posts or other content, haha. Seems like we have similar tastes. Anyway, keep up the good work. It's good to be busy. Love your instagram feed. Keep up the good shooting. And let me know if you would ever have the time to contribute. Always looking to connect with visitors. I was close to buy and level up from my Canon AE 1 to a T90 but change my mind after hold it in my hands. It was indeed extremely simple to use, hence the many keepers from it that i still have kept in my collection now.

As an artist and casual photophile, I LOVED this camera. It consumed roll after roll and never disappointed me. I didn't know any different, because it was a graduation present, so I get the flaws, but it's also a tool. Somewhere between my eye and my idea were the countless prints I made, and that's all that mattered to me. Now all digitalized and loving the jump to the 21st C, I'm glad I had this camera. It's a great camera, and under valued today. But some months ago I baought a T50 on a whim and I'm amazed. It's the SLR Equivalent of my Olympus XA2. Totally inobstrusive and liberating. Hang the F1 around your neck and you suddenly become a target. They both take AA batteries which is a Godsend. He's spent years researching, collecting, and shooting classic and collectible cameras.
