Rebel XT Manual Rebel XSi Manual We appreciate your help in caring for this item to insure its longterm use at Evergreen. Do NOT Removing the lens can cause debris to get inside the camera making the camera highly susceptible to serious damage. If the lens is removed, avoid putting your fingers inside the camera. If the mirror, or any other part of the inside of this camera gets dirty, please bring it back to Media Loan so that a qualified staff member can service the camera. Do not bend the card or put the card into the card slot backwards. If the lens is set to MF, autofocus will not be possible. Please be considerate of other users and return the white balance setting back to automatic AWB. Also, high temperatures, high ISO speeds, or long exposures may cause irregular colors in the image. The camera automatically sets the shutter speed and aperture value to suit the subjects brightness. The camera will automatically set the aperture value to suit the subjects brightness. A faster shutter speed can freeze the motion of a fastmoving subject. It is effective for group photos or landscapes. Special software such as Adobe Bridge or Photoshop is required to view the images or edit them for printing. Try and test before assuming your setup will work for major projects.

<http://myrola.com/images/Designer-Topaz-20-Manual.pdf>

Liveview, Spot metering and a few moved buttons see diagram, right are the more relevant changes made. Live View only works in the creative zone modes, so make sure to set the shooting mode accordingly. Select "Live View Function Settings" and press SET. This image will reflect the actual brightness of the captured image. If this guide does not help you with your problem, please return the camera to Media Loan and describe the issue to a staff member. And by having access to our ebooks online or by storing it on your computer, you have convenient answers with Canon Eos Digital Rebel Manual. To get started finding Canon Eos Digital Rebel Manual, you are right to find our website which has a comprehensive collection of manuals listed. When you purchase through links on our site, we may earn an affiliate commission. Learn more One of the biggest differences, however, is that it offers WiFi for sharing images and remotely controlling the camera. Most other improvements, like a faster processor, are under the hood. But the bottom line is that the T6 provides all the basic functions and features you need to take great pictures. Weve outlined some of the recommended steps to get the most out of your camera in the following guide. MORE How to Take Great Pictures with the Canon T5 Quick tips 1. Start with the P program auto mode. Then, gradually work into shooting in TV shutter priority and AV aperture priority, before moving on to full Manual mode M. For movies, move the mode dial to the movie camera icon; the camera automatically enters Live View. Then, press the camera icon next to the viewfinder with a red dot to start or stop recording video. Canon EOS Rebel T6 View Deal Getting to know the Canon T6 controls The mode dial The mode dial is where your picturetaking decisions begin. The selected mode not only determines how the exposure is determined but also how many other features and controls are accessible to you.

<https://gpwestlondon.com/images/Designing-A-Training-Manual-Templates.pdf>

For example, automatic settings such as Auto, Portrait, Landscape and Food turn most control over to the camera while leaving you limited options for features such as white balance. Manual controls such as Program, Aperture priority, Shutter speed priority, and Manual exposure modes provide more user options for exposure and allow access to all of the other features the camera offers. Though the fully automatic modes are easy to use, youre better off getting to know — and using — what is often referred to as PASM Program, Aperture priority, Shutter priority and Manual. On the

T6 mode dial, Aperture priority is labeled as AV aperture value, and Shutter priority is labeled as TV time value. The camera will automatically change the aperture at the same time to ensure a proper exposure. Using the viewfinder when shooting helps stabilize the camera, since its braced against your face and your arms are not outstretched. So try to shoot with the viewfinder when using slower shutter speeds. This not only allows more light to hit the sensor for exposure but also delivers a shallow depth of field, which is perfect for portraits, since it blurs the background and emphasizes the main subject. For landscapes, you want a broader depth of field, so more of the image is in focus. Keep an eye on the exposure gauge in the viewfinder or on the LCD in Live View. When the mark is in the center, the image should be accurately exposed. The T6 also offers a fully Auto mode look for the green A icon, a flashoff mode for when you cant or dont want the flash to automatically pop up if needed, a Creative Auto mode, and a handful of scene modes, such as Portrait, Landscape, Food and Closeup. Check the camera manual for full explanations of each. But be aware that your options are limited with all of these modes, and one of the keys to taking great pictures is putting yourself in control.

Other important controls The T6 is equipped with a number of dedicated buttons that allow you to quickly adjust settings. How do I shoot a portrait. There are several types of portraits, ranging from posed to candid. Most people know to stay still when their picture is being taken, so you generally dont have to remind them. As we mentioned earlier, shutter speed is the key to capturing and freezing movement. Using oneshot AF which locks in focus once when you halfpress the shutter button, I focused on the two by halfpressing the shutter button and holding it in the partially depressed position and then triggering it when they jumped out of the water. And one last thing If youre not sure where the action will take place, zoom out a little so you have extra space in the frame; you can always crop it later. How do I create cool night shots. While we often spend our time trying to avoid blur, you can create some interesting images using a slow shutter speed to blur moving subjects such as waterfalls or carnival rides. Using the Canon T6s WiFi and the Camera Connect app on my smartphone available for iOS and Android to trigger the shutter helps prevent some of the camera shake that might occur if you manually press the shutter button. See below for more info about shooting remotely. How do I shoot remotely. Canons Camera Connect app is a great way to take pictures without having to lay your hands on the camera. Its especially useful for shooting at slow shutter speeds, when even pressing the button might cause the camera to move, or when you want to photograph something where your presence might be distracting, such as wildlife. To set up a connection, follow these steps 1. Download the free Canon Camera Connect app to your smartphone or tablet. Its available for Android and iOS devices. 2. On the T6, go to the third tab of the Setup menu. Make sure WiFi is set to Enable. 3. Scroll down to WiFi function, and click Connect to Smartphone.

Leave the nickname as EOS T6, or enter a different nickname. Click OK. 4. Choose Easy Connection, and click OK. 5. Go to the WiFi settings on your smartphone, and click on the EOST6 network. 6. Enter the password the encryption key number on the camera LCD, and click Join. The little WiFi light on the back of the camera will blink while its making the connection and will show a solid green light when youre good to go. Once the connection has been made, start the Camera Connect app on your smartphone, and select the Canon EOS Rebel T6 to connect. If you get lost, follow the directions on the camera LCD and the Easy Connection Guide in the Canon Camera Connect app. Tap on the Remote Live View shooting icon. This will enable Live View on the camera. The scene in front of the lens will appear on your smartphone. You can change a few settings depending on your chosen exposure mode. Just tap the round button on your smartphone screen to capture the image, and youre all set. Note that if you change the exposure mode on the camera, youll have to reconnect all over again. Best DSLR cameras How many megapixels do you really need. Best cameras Credit Canon You will receive a verification email shortly. Please refresh the page and try again. You can unsubscribe at any time and well never share your details without your permission. Visit our

corporate site. New York. In some parts of the world, this camera uses the model number Canon 600D or EOS Kiss X5 in Japan. All these versions of the camera are identical. This workhorse of a camera continues to be widely used. This means these cameras contain professional features for manually adjusting exposure, as well as automatic features which essentially turn this camera into a pointandshoot. This tutorial will center generally on shooting photos, with a brief primer on its video features.

But unlike most other SLR still cameras, the Canon Rebel T3i can also shoot video and has a live preview mode for displaying the image on the back LCD screen in realtime, similar to many consumer digital cameras. The battery is gray with a small notch on one end where the battery make contact with the device. It is important to insert the battery with the notch pointed inward, and facing toward the front of the camera. Notice that the life of the battery decreases at lower temperatures this is true of most lithiumion rechargeable batteries. Also battery life significantly decreases when using live view mode, movie mode or the builtin flash. In order to shoot movies, it is recommended to have a memory card of Class 4 or higher speed rating. Insert the card with cardface pointed toward the back of the camera as shown below. On the bottom righthand corner of the screen, the camera will display the approximate number of images that can be stored on the camera based on the current quality settings. This number is an approximation and may change as you take pictures, as some pictures are larger file sizes than others. Next, use the cross keys to navigate among the different menu options. Press left and right keys to move between the different menu tabs, and press the set button to make a selection. The more advanced modes will display more options. The quality is defined by the amount of compression that is performed on the photo. Lower quality photos that are highly compressed are smaller in size. This will allow you to store more photos on a memory card. Eight megapixels is generally considered more than enough for web photos in fact it's a bit large but still allows flexibility to crop and adjust photos as needed. Or consult the other sections of this tutorial for doing manual settings. It's important to make sure the autofocus switch is set to AF to enable autofocus. This is especially useful when zoomed in on subjects far away while handholding the camera.

The image stabilizer is not useful in situations when the camera is on a tripod, or you are taking mostly wideangle pictures in welllit conditions. The image stabilizer will use additional battery power to operate, so turning this option off may help to increase the shooting time. This is the best position for stability and reducing the chances of dropping the camera. Holding the shutter button halfway down will activate the autofocus, charge the flash if needed, set the exposure and prepare the camera for taking a picture. If you press the shutter button down all the way without holding it at the halfway point first, it may cause a slight delay before the camera will take a picture. The camera does all of the work for you. There are a number of different automatic features that allow for some flexibility to adjust the camera in a number of ways based on the subject matter you are going to photograph. It's best to think of the green rectangle as the middle option; everything below the green rectangle is an form of automatic called basic zone, and everything above the green rectangle are more advanced features for experienced photographers called creative zone. The camera is essentially a pointandshoot camera, with all the exposure settings done automatically for you. Simply put the camera into this mode, point the camera, and take a picture. The flash will automatically pop up if there is low light and the scene requires it. This mode is useful for situations where a flash will be a distraction, or is not permitted. To compensate for the low lighting, the camera will increase the sensitivity of the sensor ISO and may result in grainierlooking photographs. It allows you to adjust the depth of field, control whether the flash fires, and set the drive mode continuous shooting when you hold the shutter button down. Once in this mode, the settings can be adjusted by pressing the "Q" button on the back of the camera, and navigating to the different options.

This mode will automatically set the aperture to its widest possible setting so the depth of field is shallow thus causing background to be blurry. The amount of blur will largely depend on the type of lens being used, and sometimes will depend on how close you're zoomed on the subject. Most zoom lenses will reduce the aperture when zoomed at its fullest setting, thus preventing blurry backgrounds. Instead of blurring the backgrounds, landscape mode will try to get as much in focus as possible. This setting is ideal for taking pictures of scenes or wide shots of large areas where everything should be in focus. In this mode, the flash will not pop up and fire because the camera assumes that the subject matter is too far away for a flash to be effective. This mode will automatically set the aperture to its narrowest possible setting so the depth of field is wide thus causing everything to be in focus as much as possible. This mode will adjust various attributes of the camera to prepare it for bringing out the detail in closeup pictures. It also tones down the flash so it doesn't blow out the subject matter, as what typically happens in situations when the camera is too close to the subjects. Note that all lenses have a minimum focusing distance. This is the minimum distance the lens can physically be to the subject before the lens can no longer show the subject in focus. For some zoom lenses, this can be a long distance. In these cases, it's best to zoom in as much as possible while keeping the subject in focus. It works best outdoors or when there is a lot of light. It attempts to reduce the amount of motion blur as much as possible by using high shutter speeds. Sport mode will always be restricted by the amount of available light in the scene, and when it's too dark, motion blur may be introduced into the scene. Night mode attempts to bring out the background lights that often are lost when using flash photography at night.

It's important to note that if you don't use a tripod with night mode, your photos are likely to end up blurry. The Creative Modes are for more advanced users familiar with camera functions such as exposure settings. In the creative modes, the camera can still offer some automatic functions, but the photographer is largely given control over various aspects of taking a picture. You also can switch through different shutter/aperture combinations in this mode, choosing the best to suit your needs. To do this, press the shutter button half way and use the dial next to it to scroll through the settings. You can manually set the ISO light sensitivity of the camera's sensor. To switch through the different combinations, use the wheel next to the shutter button. All these manual settings can be used in the Tv, Av and M modes described below. You can set the shutter by clicking the wheel next to the shutter button. You can set the aperture by clicking the wheel next to the shutter button. The camera does not provide any type of auto exposure adjustment. The camera will display a meter showing whether the current setting is over or under exposed, and by how much. You can change the shutter speed by clicking the wheel next to the shutter button. To change the aperture, hold down the "Av" button on the back of the camera, and click the wheel next to the shutter button. The camera will attempt to bring all of the subjects into focus by adjusting the aperture setting required to bring them into focus. Once in the menu, you can use the cross keys to navigate among the different options in each menu. The Q button will highlight one of the options on the back LCD screen. You can now use the cross keys to navigate among the different options. Press set to select one of the options and change its settings. This menu is useful for adjusting more nuanced settings within each mode.

But if you wish to turn this menu off, you can do so by pressing the DISP button at the top of the camera near the main shutter button. The Q button will enable you to navigate among the different options on the back of the camera to adjust the options. When using the basic modes, only a few options are available for adjustments. Let's take a look at the options presented in Creative Auto mode. While this may seem like a good idea on a consumer level, we recommend to never change from the standard setting because changes to the colors is a very simple process to do in Photoshop. You should always bring in the most basic image in the camera, and make adjustments in post production rather than in the camera. The blur is not an effect that is added to the photo, but a result of using wide aperture settings in the lens that creates a shallow depth of field. Blurry

backgrounds are a great way to bring out the subjects in your photos, but they are difficult to achieve in certain lighting situations with certain lenses. The drive setting refers to the ability of the camera to take pictures continuously as you hold down the shutter button. If you hold down the shutter button in this mode, the camera will only take one picture until the button is released. The multiple squares option is for continuous shooting of photos. Press the shutter and the camera will take a rapid series of photos as long as you hold down the shutter button. The other two options are for delay timers in situations where you might want take a photo of yourself. Creative auto and other modes allow you to change the flash options. The lightning bolt option, will force the camera to use flash, even if it doesn't need it. This is useful in daylight for filling in shadows. The noflash option will prevent the flash from firing, even if the scene is too dark. Updated by Berkeley AMI on December 12, 2019. Check out the latest posts in our blog.
