You may also add notes to any stored result by using the on board alphanumeric keypad, thereby making later identification of results straightforward. DLRO600 will check the continuity of the test circuit, and will quickly ramp the test current up to the desired level. The keyboard is also used to set upper and lower limits for the result and to prevent the use of excessive currents by setting an upper limit to the allowable test current. Connect the test leads, select the test current and press the TEST button. DLRO600 will pass a current continuously, and measure the resulting voltage at 2 second intervals, until the test button is pressed to stop the test or the test circuit is interrupted. The test current will ramp up to the desired level, hold for 2 seconds and then ramp down. The whole process takes approximately 7 seconds. The TEST lamp will flash to show that the DLRO600 is ready to carry out a test. As soon as the potential leads are connected, a test will start. To repeat a test, simply break contact with the voltage probes and remake contact. The two current leads are connected to the ends of the busbar. Normal tests just like you'd expect and applies a current to measure resistance for a few seconds.

Continuous maintains the test current over a time period to measure resistance differentials, and auto mode automatically applies the most applicable level of current to ensure that results are as accurate as possible. Tests on the DLR600 also use fourwire methods, ensuring that the effects of the resistance of the leads doesn't interfere with the resistance reading. An alphanumeric keypad also allows notes and adjustments to be made to stored data, while an RS232 port on the tester allows download to PC and a printer. DLRO600 equally at home in the workshop, on the production floor or in As well as adding notes DLRO600 uses a four terminal measurement technique to cancel the resistance of the test leads from the measurement. Megger DLRO600 Test Modes DLRO600 operates in one of three modes, which are simply selected from the on screen menu.

CONTINUOUS mode is provided for users who wish to monitor a resistance over a period of time. Connect the test leads, select the test current and press the TEST button. DLRO600 will pass a current continuously, and measure the resulting voltage at 2 second intervals, until the test button is pressed to stop the test or the test circuit is interrupted. In NORMAL mode you connect the leads, select the test current and press the TEST button. The test current will ramp up to the desired level, hold for 2 seconds and then ramp down. The whole process takes approximately 7 seconds. In AUTO mode select the desired current, connect the current leads and press the TEST button. The TEST lamp will flash to show that the DLRO600 is ready to carry out a test. To repeat a test, simply break contact with the voltage probes and remake contact. Measuring individual joints in a busbar is a good example of the convenience to be gained by using AUTO mode. The two current leads are connected to the ends of the busbar. When the voltage leads make contact across a joint, DLRO600 detects that all four leads are connected, carries out a test and stops.
