A database is an organized collection of records. Telephone and address books are examples of paper databases. With Access, you can create a computerized database. For example, you can use Access to organize the students who attend a school, the courses they take, and the instructors who teach them. After you create an Access database, you can search it, manipulate it, and extract information from it. This lesson introduces you to Access windows and teaches you how to create a database. Access stores data in tables. This lesson teaches you how to create a table, add fields to a table, assign data types to fields, and set field properties. This lesson teaches you how to modify a table and enter data. This lesson teaches you how to sort and filter an Access table. Relationships join tables together so you can work with the data from multiple tables. This lesson also teaches you how to create relationships. For example, if you want to view a list of student names and email addresses, but you do not want to see addresses and other data, you can create a query that displays the student's first name, last name, and email address only. The proper way of connecting to Microsoft Access databases, either the MDB or ACCDB formats, is through an OLE DB connection. Though it is technically possible to connect to MDB files through the Add Data dialog box in ArcMap, it is not the recommended workflow. With the new Microsoft Access format, accessing ACCDB files directly through the Add Data dialog box is not possible. Reading these databases requires installation of the correct ODBC drivers. Because of this, it requires 32bit ODBC drivers to make database connections. If Office 2007 or Office 2010 x86 32bit is installed, the 32bit Microsoft Access Database Engine is likely already installed. If Office 2010 x64 64bit is installed or Microsoft Office is not installed at all, the 32bit database engine must be installed before a connection can be made to Microsoft Access databases in ArcGIS Desktop.

It is not possible to install the 32bit 2010 Microsoft Access Database Engine if 64bit Microsoft Office 2010 is installed. This is a limitation as described in Microsoft Article 2269468. In this scenario, the 2007 Microsoft Access Database Engine can be installed. The 2007 engine can read both 2007 and 2010 Access databases for OLE DB purposes. Navigate to the drivers tab. If the Microsoft Access Driver lists .mdb and .accdb, then the correct drivers are installed. In this case, skip to Step 4. If the Microsoft Access Driver only lists .mdb, the necessary driver is not installed. If 64bit Office 2010 is installed, the 2007 Access Database Engine must be installed. Otherwise, the 2010 Access Database Engine 32bit can be installed. After installing the engine, several new drivers appear in the ODBC Data Source Manager, including drivers that are able to read .accdb files. The Microsoft Access Driver now lists .accdb as a file type it supports. To locate this utility using ArcGIS 10 or older, see the 10.0 Web help document Adding OLE DB connections. If using ArcGIS 10.1 or newer, see the 10.1 Web help topic Adding OLE DB connections to databases. In the Data Link Properties dialog box, select the Microsoft Office 12.0 Access Database Engine OLE DB Provider. The Microsoft Office 12.0 Access Database Engine Provider was installed with either Microsoft Office or the Access Database Engine. For Step 1, Data Source, either type or copy and paste the location to the ACCDB file. The ability to browse to an ACCDB file in this dialog box is a Microsoft limitation that cannot be addressed by Esri. Click the Test Connection button. A message appears stating whether or not the test connection was successful. Click OK in the Data Link Properties dialog box. Optionally, the new OLE DB Connection can be renamed something that relates to or identifies the database. Clicking the plus sign next to the database also displays the contents.

<http://superbia.lgbt/flotaganis/1655324243>

The contents of this database can now be used in most ArcGIS dialog boxes by navigating to the Database Connections folder. Tables and queries can also be dragged and dropped from the Database Connections into ArcMap or tool dialogs. There are a few limitations to be aware of when working with OLE DB connections. See the link in the Related Information section below for more

The key to solving this. SAS Enterprise Guide can open data sources using ODBC. Its ironic that Im writing about this, since I am on record as recommending against using ODBC directly its not the most efficient method of bringing data to SAS because it pipes third party data to your SAS server via your Windows client. However, in this case its a handy enabling technology. If you have Microsoft Office 2007, you probably already have these drivers.

But if you dont, you can download them from Microsoft and install them no Microsoft Office products needed. Its a valid warning, but applies more to folks who use ODBC to connect to humongous data stores such as Oracle or Teradata. Since you trying to open smaller data sources typical for Microsoft Excel and Access, the warning doesnt apply.as much. This is where you will define your DSN database source name for ODBC access. The issue is that Microsoft does not officially support, nor endorse, the coexistence of both 32bit and 64bit Office applications and drivers on the same computer. This can be prevented from happening byIt does not work with 32bit Microsoft Office 2010, 2013, or 2016. If

you have installed the 32bit Microsoft Access Database Engine 2010, or 2016, you must uninstall this too. MICROSOFT ACCESS is a Database Management System offered by Microsoft. It uses the Microsoft Jet Database Engine and comes as a part of the Microsoft Office suite of application. Microsoft Access offers the functionality of a database and the programming capabilities to create easy to navigate screens forms. It helps you analyze large amounts of information, and manage data efficiently. The database file is saved to your hard drive or other storage devices. Datatypes  
Datatypes are the properties of each field. Every field has one datatype like text, number, date, etc. A Table is usually related to other tables in the database file. Each column must have Unique name We can also define Primary Key in a table. Query Queries answer a question by selecting and sorting and filtering data based on search criteria.

Queries show a selection of data based on criteria limitations you provide. Queries can pull from one or more related Tables and other Queries. Types of Query can be SELECT, INSERT, UPDATE, DELETE. Form A form is a database object that you can use to create a user interface for a database application. Forms help you to display live data from the table. It mainly used to ease the process of data entry or editing. Report A report is an object in desktop databases primarily used for formatting, calculating, printing, and summarizing selected data. You can even customize the reports look and feel. Macros Macros are mini computer programming constructs. They allow you to set up commands and processes in your forms, like, searching, moving to another record, or running a formula. Modules Modules are proceduresfunctions which you can write using Visual Basic for Applications VBA. MS Access Datatypes MS Access common data types are listed below

Type of Data	Description	Size
Short Text	Text, including numbers which does not need calculation. e.g., Mobile numbers.	Up to 255 characters.
Long Text	This data type is used for lengthy text or alphanumeric data.	Maximum 63, 999 characters.
Number	Numeric data type used for storing mathematical calculations.	1, 2, 4, 8, and 16 bytes. Usually used as the primary key
Replication ID	Four bytes 16 bytes if it is set as a Replication ID.	Multiple files can be attached per record. Up to 2 GB Data can be stored.
OLE objects	OLE objects can store audio, video, other Binary Large Objects.	Up to 2 GB data can be stored.
Hyperlink	Text or combinations of text and numbers stored. That text is used as hyperlink address. Each part of a Hyperlink data type allows you to store a maximum 2048 characters.	
Calculated	Helps you to create an expression that uses data from one or more fields. You can create an expression which uses data from one or more fields.	

Differences between Access and Excel  
Microsoft Access and Excel are very similar yet very different.

Here, are some important difference points between both of them Access Excel Deals with text, numbers, files and all kinds of data Microsoft Excel generally deals with numerical data All the data is stored one time, in one place. Lots of worksheets or documents are a store with similar, repeated data. Helps you to build highly functional data entry forms and report templates. Only the primary data entry screen is available. Users will be able to enter the data more efficiently and accurately. Data accuracy and speed is not much because of the format. Easy to import data from multiple sources into Access You can easily customize Access according to personal and company needs Access works well with many of the development languages that work on Windows OS It is robust and flexible, and it can perform any challenging office or industrial database tasks. MSAccess allows you to link to data in its existing location and use it for viewing, updating, querying, and reporting. Allows you to create tables, queries, forms, and reports, and connect with the help of Macros Macros in Access is a simple programming construct with which you can use to add functionality to your database. It can perform heterogeneous joins between various data sets stored across different platforms Disadvantages of MSACCESS Here, are the cons for using MS Access Microsoft Access is useful for small to medium business sectors. However, it is not useful for large sized organizations Lacks robustness compared to DBMS systems like MS SQL Server or Oracle All the information from your database is saved into one file. This can slow down reports, queries, and forms Technical limit is 255 concurrent users.

However, the realworld limit is only 10 to 80 depending on the type of application which you are using It requires a lot more learning and training compares with other Microsoft programs

### How to Start Microsoft Access

Note We assume you have the latest Microsoft Access installed which comes bundled with Microsoft Office 365 package. There are two ways to Start MS Access. From Windows, Start button. Lets have a look of starting MS ACCESS using both the ways

#### Option 1 From Windows, Start button.

Step 1 Click on the Windows icon. You will find the list of installed programs. Step 2 Check and click on Access Icon. Step 3 MS Access Application window will appear Steps 4 Press Esc Result This will open the MS ACCESS windows application

Step 1 Right Click from Desktop and Click New Step 2 Click on Microsoft Access Database Option Step 3 Below MS Access Application window will appear Step 4 Press Esc Result This will open the MS ACCESS windows application

### How to Create a Database

Before we create Database, lets quickly understand the holistic picture of what Database is, with particular reference to MS ACCESS. Similarly, we have MS Access Database is a kind of home for all your tables, queries, Forms, Reports, etc. Technically, Database store the data in a wellorganized manner for easy access and retrieval. There are two ways to create Database in SQL ACCESS

#### Create Database from Template

##### Create a Blank Database

Lets go into the detail of each Create Database from Template There are many situations where we need to start with some readymade database template for given requirements. MS Access provides many ready to use templates for such types of databases requirements where the data structure is already defined. You can keep customizing the template structure further as per our requirement. MS ACCESS Database template example includes Contacts, Student, Time tracking, etc.
