**Book Descriptions:**

We have made it easy for you to find a PDF Ebooks without any digging. And by having access to our ebooks online or by storing it on your computer, you have convenient answers with Dsnrexx Manual . To get started finding Dsnrexx Manual , you are right to find our website which has a comprehensive collection of manuals listed.
Our library is the biggest of these that have literally hundreds of thousands of different products represented.

**Book Descriptions:**

# Dsnrexx Manual

Scripting appears to be disabled or not supported for your browser. Enable JavaScript use, and try again. When you sign in to comment, IBM will provide your email, first name and last name to DISQUS. That information, along with your comments, will be governed by By commenting, you are accepting the. This is done by creating a JCL project and then associating it with an XA resource, enabling you to run a DSNREXX procedure using sample JCL provided with You can create a sample database by running the Before building the switch module, ensure that your LIB environment variable contains the path to your Windows SDK LIB directory. This is a standard security dialog box. Also, if prompted to disable password recovery, click Ensure that you use an expanded path. This is a standard security dialog box. Click Also, if prompted to disable password recovery, click To do this you need to create a Dynamic PDS. See. Allocate the library, or ask your support for help. So unless youve verified every library in your concatenation list is authorized, you can say the library itself is authorized but you cannot say your access to it is APFauthorized. Where is that Where is that It does not check the validity of said entry. Thus, consider the following code fragmentI cant find why it is not allowing me to do so. The same task I can do it by TSOLIB.Load module is there in the dataset. I want to add this load dataset dynamically. Linklist addition of DB2 load lib is not allowed at my site.For an alias name, ensure that the entry point attributes match that of the load module which was previously loaded that is, authorization, RMODE, entry point displacement. And in which library I can find the DSNREXX load. It is available since DB2 Version 5. If you are getting an error running the procedure then you need to check if your shop has installed the interface. Check HLQ.SDSNLOAD library in your system where it normally resides.I found the loadlib. But still I couldnt connect to DB2.[http://kerryparsonsfoundation.org/media/d-link-dsl-520b-manual.xml](http://kerryparsonsfoundation.org/media/d-link-dsl-520b-manual.xml)

Do we need a PLAN or maybe something allocated to get this to work.You can run job DSNTIJRX from the SDSNSAMP library if you havent done this already. Plus do you check if the DSNREXX environment is available as follows. Post by Hamilton, Robert We get a 1 return from ADDRESS DSNREXX CONNECT DSNT Per the SQL manual. Do we need a PLAN or maybe something allocated to get this to work.In my DB2INIT subroutine I do it like this SUBCOM DSNREXX if rc 0 then call rxsubcom ADD,DSNREXX,DSNREXX I think until you do that, at most installations DSNREXX isnt available. Do we need a PLAN or maybe something allocated to get this to work.Now have a problem with the PREPARE. Do we need a PLAN or maybe something allocated to get this to work.All the research Ive done in the past have required assembling programs and such.That is forbidden, at shops that dont want to support things after a developer moves

Bob Hamilton wrote We get a 1 return from ADDRESS DSNREXX CONNECT DSNT Per the SQL manual. Ive copied an example of how I have set things up for several DSNREXX invocations. There are of course a few issues with the coding and to name one or two the example assumes the whole resultset fits into virtual storage. If you want to process row by row or subset by subset youll have to adjust the coding to your liking. the arrays are build up using the interpret command. As a result the arraynames are exactly the same as the columnnames of the SQLstatement. And as an example of how to do this for a column that represents a function of one kind or the other I also gave an SQL statement.Are all those true If so, post your code and trace output so we can see whats happening. You can also search the archives here and on db2l since the rexx interface has been discussed quite a bit. I use DB2 a lot, and would like to access it from batch jobs using REXX. All the research Ive done in the past have required assembling programs and such.That is forbidden, at shops that dont want to support things after a developer moves on. Do we need a PLAN or maybe something allocated to get this to work.I include a statement like the above in every REXX that needs to do a SELECT.I suppose it would work with other statement types than SELECT, but thats all I ever do in REXX. I can have multiple DOSQL calls, and can have more than one open at once; the first argument 1 in this case specifies the cursor number. So its packaged, but not exactly neatly. Do not go near the edges of it. The edges of the air can be recognized by the appearance of ground, buildings, sea, trees and interstellar space. I could not figure out its DENREXX or EXESQL or connection etc etc. I need to write a rexx script that will query a database table and will process the rows returned and save them in an output file. I would highly appreciate if someone can share such an example code. Thanks.

Also one of the DB2 user manuals has an entire section devoted to Rexx. Regards Nic Problem is information is scattered all over and I could not find one single script that will do the job. Mostly its for REXX working with some other types of databases. I am not sure about db2 manual I will check there too but I was hoping if someone has some example that I can use. I have spent a lot of time trying to find one. To get to the manual click on IBM Manuals at the top and bottom of each page on this forum, scroll down to databases, select the DB2 Programming Guide nearest to your level it has hardly changed over the years and you need section 2.4.6. BTW I am sure that there are samples withn the forum. Regards Nic I am still searching. Hi NicC Thanks for your time and effort too. Even in that its only generic syntax and not any example.The manuals start at V5 and go up to V9 you obviously did not scroll down far enough. EXECSQL is a command that is understood by DSNREXX. Therefore you heve to pass it to DSNREXX. Apart from not looking hard enough for the manual you are obviously not reading it carefully enough. Regards Nic Dont forget to switch your DSN environment if you need something like write output to a file. At present, I can get it to either read from Teradata or DB2, but not both. When I try to read from both, the Teradata one which runs first works fine but the DB2 read gives an error of RC1 upon attempting to open the cursor. Anyone know how I can get this to work Apologies for not correcting this earlier. When this was changed to reading from Teradata first before having anything to do with DB2 at all, it worked. You can look this up in the DB2 Application ProgrammingI actually had a fix for this see edit for explanation a while ago, but forgot to post it. However, I still have next to no idea why the old implementation didnt work. Ill mark this as the correct answer if you can help clarify.

It probably has something to do with the specific query, and when you reworked the program, the query was slightly different, you used a different cursor, or something. Please be sure to answer the question. Provide details and share your research. Making statements based on opinion; back them up with references or personal experience. To learn more, see our tips on writing great answers. Browse other questions tagged db2 mainframe teradata rexx or ask your own question. August 15,

2008 Session 8332 KTomiak.org 2 Cornerstone Systems, Inc. About Cornerstone Systems Founded in 1991, Cornerstone Systems has established itself as an IBM Premier Business Partner and leader in providing infrastructure support solutions. Cornerstone Systems Inc.Its professional staff is authorized and trained in the sale and support of all IBM eserver and storage product lines. Cornerstone Systems Inc.We also specialize in industry leading ISV products, assuring you a complete and flexible software solution. Services offerings include 24 x 365 client hotline, assigned project managers, and technical staffing backup solutions. From migrations, installations and implementations, to product maintenance, financing and education, we have a vast network of information, tools, and most importantly people to deliver customers proven, cost effective services. Contact Information Cornerstone Systems, Inc. Hotline 3 ABSTRACT In this session, the speaker will provide a quick overview of the DB2 API for Rexx and then highlight two ways to use DSNREXX and how to display the SQL Communication Area SQLCA. A simple SELECT is demonstrated to show how to list databases in your DB2 subsystem using compound variables. Then super size the code to use simple variables to be even more dynamic. Finally, invoke a STORED PROCEDURE to retrieve system parameters using DSNWZP. Fill out a session evaluation form. Useful comments are appreciated. Suggestions are welcome. share.org ktomiak.

Error 805 isThe full message will tell you what DB2 can not find. If you can not find it, try looking in your TSO job outputThere is another code that does the following. Restores a database using the SMO Restore.SqlRestore method, which leaves the database in the Restoring. state. Then applies some Sql code. The Sql code isBut, if I am running the same code using the Ado.Net based function above, it fails on trying to open a connection to the database. So, how does InvokeSqlCmd do it and what can be changed in the Ado.Net code above to work too I have several

databases SqlServer 2005 on the same server with the same schema but different data. I have one extra database which has one table storing the names of the mentioned databases. Am I clear Let me give you an example simplified from the real one. CREATE TABLE DatabaseNamesName varchar50INSERT INTO DatabaseNames SELECT DatabaseB. INSERT INTO DatabaseNames SELECT DatabaseC. Assume that DatabaseA, DatabaseB and DatabaseC are real existing databases. So lets say I need to create a new SP on those DBs. I need some script that loops over those databases and executes the TSQL script I specify maybe stored on a varchar variable or wherever. Any ideas Thanks!Moreover, you cannot have a GO in a string to be EXECuted. I found a commandline solution invoking sqlcmdSample code uses current Windows login to query all active databases from Master replace with your own connection and query for databases, and executes a literal TSQL command on each database thus found. line breaks for clarity only.

Have a look at the commandline parameters of sqlcmd. You can pass it a TSQL file as well. If you want to allow manual selection of databases, have a look at SSMS Tools Pack.OPEN cDEALLOCATE c. However, obviously it will not work for statements that need to be the first statement in a batch, like CREATE PROCEDURE. For that you can use SQLCLR. Create and deploy a class like thisThen you can do. OPEN cDEALLOCATE cOPEN cAlso, as some have pointed out. This approach is problematic if you want to run a command that needs to be the only thing in a batch. Here is an alternative for that situation, but it requires more permissions than many DBAs might want you to have and requires you to put your SQL into a separate text file. OPEN cDEALLOCATE cPs. Have a look at how to use USE with a parameter hereYou do not need to create any other stored procedures or cursors. Given your table of database names is already createdExamplePRINT Database NameI have written the below procedure but no matter what I pass to it,I have passed all INTAny ideas what I am doing wrong Thanks.That isnt going to happen.theyll just return from the function. Youll need to raise an error, not trigger a Return.For example imSchool, New York University. I am thinking my SQLQuery is bad because when I run the Stored Procedure in MSSQL with the same input I get a return table everytime. SQL Server 2008 R2 and Classic ASP. HERE IS MY IF STATMENT WITH SQLQUERY CODE keep in mind the 1st one works fine and data is selected from the DBEnd IfThis should workOr in your example, if you close the first rs object before you go on to the next, it may help. So like thisEnd If. By joining you are opting in to receive email. Students Click Here TekTips Posting Policies Getting Rexx to talk to DB2. I have allocated my DB2 loadlib in my profile, but I keep getting this error message when I attempt to connect to DB2. IRX0562E Abnormal completion of the READ Data Management macro.

I can run REXXs in a batch environment, but I have the loadlib specified in the steplib. Thanks in advance, dxs IRX0562E Abnormal completion of the READ Data Management macro.Thanks, dxs I checked for a typo, but there was none. The next thing I started to research was the ISPSTART command. Do I need to have this inside of my online REXX or is this only for BATCH environments. Is there a different way to issue a DB2 REXX command besides TSO rexxname. Thanks, dxs Do you invoke ISPFFunktions or Panels. It should be working when you start a REXX with TSO rexxname. Try TSO ISRDDN and look at your ISPLLIB. Do you find your DSNLOAD there. Regards, Thomas I then did an ISP Libdef statement. Now Im getting this. ISPS102 Invalid service name DSN is not a recognized dialog service name. Current dialog statement DSN SYSTEMT10D Im not sure why its not recognizing the call to the DB2 subsytem, but Im looking through some manuals now. Hopefully I find an answer. Thanks again everyone, dxs Reasons such as offtopic, duplicates, flames, illegal, vulgar, or students posting their homework. The TekTips staff will check this out and take appropriate action. Already a Member Login Unauthorized reproduction or linking forbidden without expressed written permission. Registration on or use of this site constitutes acceptance of our Privacy Policy. Its easy to join and its free. And similarly for other SSs if required. You have already posted the answer if i understand the question. You need to write the code to run a query to read each subsytem or a common query that you provide a subsystem parameter when the original is not

found. You have already posted the answer if i understand the question.Hello DikDude!!!!! I understood what you are saying. But what i am saying is 1. First i should start writting a simple Rexx code Which i have already started on for only one Subsystem to execute a HardCoded SELECT query which will display the result if row found. 2.

Now, after executing above succesfully, I will replace that HARDCODED query to replace with a user input. 3. Then i can go on to add more subsytems and finally achieve what i want. So please help me write the code for Step 1 above. What the code will be As someone whos very familiar with REXX and has written many REXX SQL queries for Oracle, I had no idea if I might be able to offer anything or not. If you post what you have done so far, someone will probably have a suggestion... You should also clarify the requirement. First you sayRun job DSNTIJRX to do this. Before you run DSNTIJRX, make the following changes Add a job statement. Change DSN SYSTEMDSN to DSN SYSTEMssid, where ssid is the name of the DB2 subsystem on which you will use DB2 REXX Language Support. Change all instances of DSN!!0 to your DB2 data set name prefix. How can we do that Can you please provide an example and or share some links to learn them. Certainly.By establishing a DB2 environment via RXSUBCOM most shops use the IBMsupplied DSNREXX command processor; mine, however, uses Open Softwares RXTASQL. Then, you can use embedded or dynamic SQL as with any other language.See here. Many examples and references over the Internet and, as Akatsukami has pointed out, in the DB2 manuals themselves which you, obviously, did not consult. Intro to DB2 UDB. Programming Using REXX. Abstract. In this session, we overview the various DB2 REXXIBM DB2 Universal Database FamilyUses SQL languageHosts. DB2 for VM and VSEEnterprise. WinCE. PalmOSWin. Enterprise Extended. PersonalEdition. DB2 is a clientserver database, so you can install a small DB2 client on your platform, which connects over. The personal editions of DB2 allow you toDB2 is a multiple platform product family, with DB2 running on MVS as its premier platform, although the. Windows and UNIX implementations are quite capable.

DB2 exploits the advanced features of MVS, such as Parallel Sysplex, data spaces, multiple address spaceNotesProgram Products DB2. Database. TableSpace. Foreign KeyStroustrupKernighanCowlishawRitchieThompsonKeyData is retrieved and updated using the SQL language. All DB2 data is stored in tables, with rows and columns. All the data in a given column must be the same data type text, integer, time, etc.. Data in one table can be related or joined to data in another table, using the primary key data. Unlike otherNo two rows in a table can have the same primary key; each must be unique. A table space is an area in a database that contains one or more tables. The data is stored by MVS DB2 in. VSAM linear datasets. NotesDB2 UDB Application Development ToolsScript CenterUse to perform administrative tasks such as configuring the system,Create scripts containing DB2 commands, SQL statements, andYou can schedule scripts to run unattended, on a schedule, which isJournalNote that not all toolsNotesDB2 UDB Control CenterIt allows you to navigate to various DB2 systems, display theDB2 UDB Command CenterJust place your cursor on an SQL statement, and press CtrlEnter or click the green arrow. You can scroll through the results and save the output to a file. There is also a DB2 Command Line Processor and a DB2 Command Window shown below, which is aIt is smallSQL Programming APIsThe precompiler also produces an access package in the database and, optionally, aThe access package contains access plans selected by the DB2 optimizer for the static SQL statements inFor dynamic SQL statements, the optimizer creates access plans when you run your application. The bind file contains the SQL statements and other data required to create an access package.

You can useThe rebinding createsYou need to rebind your application if itYou should rebind yourYou do not need to precompile or bind DB2 CLI applications; they use common access packages providedThe MVS DB2 Version 6 Refresh released in May 2000 introduced the MVS DB2 REXX Interface. It has beenNotesTypes of SQL Statements. Modify data in tables. Select. Retrieve data

from one or more tables. Insert. Update Modify the contents of a set of rows. Delete. Remove a set of rows from a table. Add tables, indexes, etc. Create Create a new database or database object. Alter. Modify characteristics of an existing database or object. Drop. Delete a database or database object. Used to control security. Grant. Grant access to a given database object. Revoke Remove access to a given objectSQL 99 standard came out around 2002. The DML statements are pretty portable from database to database and platform to platform, althoughDDL statements are somewhat less portable, but still largely portable between platforms. DCL statementsNotesSQL Patterns. Selecting from a table. Updating a tableDeclare cursor for SelectInserting into a tableCommit inserts. Disconnect. Deleting a row from a tableCommit deletes. DisconnectNotesDB2 DefinitionsThe SQLCA is created automatically by the first ADDRESS. DSNREXX CONNECT or CALL SQLDBS ATTACH TO. The DSNREXX SQLCA is a set of variables see next slide. The CALL SQLDBS ATTACH TO SQLCA is stem SQLCA. SQL descriptor area SQLDANotesSelected SQLCA Fields. VariableThe SQL return code. Error condition description tokensPREPARE or EXECUTE IMMEDIATE statementSQLWARN.0 SQL Warning messages data conversion. SQLWARN.10 truncation, data validation error, etc.Error Checking using the SQLCA. IF rc 0 Execution successful, with a warning. SQLCODE 100 Indicates no more data was found EOFNotesMore DB2 DefinitionsHost variables must be in upper case and prefixed withCall SQLEXEC FETCH c1 INTO,Each row is fetched into corresponding host variables.

A program can have multiple active cursors. Cursors must be closed at program terminationSQL null is not the same as REXX . Nulls are a key SQL concept that must be dealt with in your query, or in your code when you are processingIt is much easier to deal with nulls when designing the SQL query. NotesUsing an SQL Cursor. The basic steps in using a cursor areUPDATE to update an existing row. DELETE to delete matching rowPredefined SQL Cursors. REXX SQL applications must use a predefined set of cursorsBy default, c1 to c100 defined with the WITH RETURN clause; c51 toYou can modify attributes e.g. add attributes to make cursor scrollableCursors for ALLOCATE, DESCRIBE, FETCH, and CLOSE statements. Used to retrieve result sets in programs that call stored proceduresDESCRIBE, and EXECUTE statements. Note Do not use any of the predefined names as a host variableExample using cursor, SQLDA 1 of 2. Call SQLEXEC PREPARE s1 FROMsel. If sqlca.sqlcode 0 Then. Do; Say Prepare failed sqlca.sqlcode sqlmsg; Signal Exit; End. Call SQLEXEC DECLARE c1 CURSOR FOR s1. Do; Say Declare failed sqlca.sqlcode sqlmsg; Signal Exit; End. Call SQLEXEC OPEN c1. Do; Say Open c1 failed sqlca.sqlcode sqlmsg; Signal Exit; End. Say LeftName,15 RightArea,9 LeftHighpoint,15. RightHeight,9 LeftLowpoint,15 RightDepth,9. Say Copies,15 Copies,9 Copies,15. Copies,9 Copies,15 Copies,9NotesExample using cursor, SQLDA 2 of 2. Call SQLEXEC FETCH c1 INTO,Say Leftname,15 Rightarea,9 Lefthighpoint,15. Rightheight,9 Leftlowpoint,15 Rightdepth,9. Otherwise. Say Fetch sqlcode sqlca.sqlcode sqlmsg. End i. Call SQLEXEC CLOSE c1. Then Say Cursor c1 did not close sqlca.sqlcode sqlmsgAreaHeight Lowpoint. DepthDB2 UDB Dynamic SQL InterfaceSupported, documented by IBM. DisadvantagesNot threadsafe. Functionally stabilized; no new featuresDefining the Interface. If rc 0 Then. Do; Say rc; Signal Exit; End. Trace N. If RxFuncQuerySysLoadFuncs Then. If rxfuncadd SysLoadFuncs, RexxUtil, SysLoadFuncs . Else Call SysLoadFuncs.

If RxFuncquerySQLDBS Then. If RxFuncAddSQLDBS,DB2AR,SQLDBS. If RxFuncquerySQLDB2 Then. If RxFuncAddSQLDB2,DB2AR,SQLDB2. If RxFuncquerySQLEXEC Then. If RxFuncAddSQLEXEC,DB2AR,SQLEXEC. Return 0This is an internalNotesInserting Data Using Markers. Call SQLEXEC PREPARE s2 FROMsv. Call SQLEXEC EXECUTE s2,If sqlca.sqlcode 0 Then. Do; Say Execute failed sqlca.sqlcode sqlmsg; Signal Exit; EndIf sqlca.sqlcode 0 Then. Do; Say Commit failed sqlca.sqlcode sqlmsg; Signal Exit; EndHowever, it gets quite tricky if the dataThe place markers dont scale up well; when you are inserting a row which contains 100 columns, the NotesDeleting Data. Call SQLEXEC EXECUTE IMMEDIATEsu. Do; Say Execute failed sqlca.sqlcode sqlmsg; Signal Exit. EndIf sqlca.sqlcode 0 Then. Do; Say Commit failed sqlca.sqlcode sqlmsg; Signal Exit. EndNotesLaves development version is now threadsafe. Fairly mature; Open Source

development continues. DisadvantagesLimited Support Mark does need to sleep!Copy all executables and DLLs to a new or existing directoryRemember to include any new directory in the PATH.Click Add, select the database type to addThis is pretty straightforward, but there is no setuo.exe.Next run simple.cmd directly using regina as the exampleREXX function names.
