To use this website, you must agree to our Privacy Policy, including cookie policy. It also describes information tools available at eReplacementParts.com. This article describes the differences between power switch and carbon brush failure symptoms. Thank you for your question. There is a video listed with the brush, part number 38461301, that you may reference on how to install the part. Here is a link from our website where you may view the video, I hope this helps. Thank you and have a great day! That Com Bar is high the rest are OK. Open or Shorted turn cause this. Applied DC to fields from a 15vdc supply and from that it appears that both create same mag field. Ran it on 15vdc and armature still archs. If the field and armature winding looks the color of dark red or purple its a sign of a heat problem. You would then need to replace both the field and armature to do a clean repair. Hope this helps. Good luck. Tinker The armature windings are a little more difficult to detect. In this case the arm windings are poorly wound loose. The epoxy didnt bind the individual windings in place. Heat maybe but question remains Open or shorted turn. I soldered the suspected turn at the riser but didnt help if open it should have lessened the arching NO. I do work with industrial motors from 5000hp Reliance Electric so I have a good basic understanding of a DC motor but not enough to get thru this one. Thats when I call a motor expert. Still need some guidance. I took the brushes out and they looked good as well as the springs holding them in. So I shined up the armature where the brushes make contact, reassembled and still the same. Will a new armature fix the problem or is the field suspect as

well.<http://ecohouse-lab.com/userfiles/delonghi-caffe-capri-instruction-manual.xml>

One or the other would be worth replacing but probably not both. What is the general consensus. Any input would be greatly appreciated. Look again at the armature to see if any of the commutator bars are discolored or raised up higher than the others. If so replace the armature. If not, its sometimes a tough call to tell if it is the armature or field are bad. You might ask one to test your parts. Good luck, WJA. HmotnostPozor Nebezpecenstvo poranenia. Nebezpecenstvo ohna. Heavy work; but cut right through lumber nails etc with little effort. Laid the saw down for a minute to reclamp a deck section. When I picked it back up, the saw wouldn't start at all. Anybody else have this happen and resolve what caused it I was running fine then stopped. Took it down checked and tested everything. It all tested good. Then blow it clean out it back together. It worked fine. Get to the job turn it on and it goes to start. Then stopped again. Now Ive got power to everything but the brushes. Anyone else have this problem. Saw is about 3 years old with less then 300 hrs I dont have a wiring diagram but the serieswound brush type motor hardly varies regardless of its application.

These motors are electrically very noisy and a high powered version is perpetually almost at the point of self destruction and so to prevent radio frequency interference they have to be heavily suppressed and suppression also helps protect the motor from itself. Some manufacturers use discrete components for this purpose but some use a single component that is a network of capacitors and inductors, that necessarily is compact and therefore highly stressed and these do fail sometimes. As a saw doesnt usually have a speed control, all the components can be checked for continuity with a multimeter unless it is fitted with a soft start, the testing of which is beyond the scope of home testing. If everything else is found to be ok the problem is likely with the soft start if fitted. The current usually flows through a series wound motor from the switch to a field coil, through the field coil to an armature brush, through the armature to the other brush and then through the other field coil to the neutral. There can be slight variations to this but basically the armature is in series with the field coils. If you have power to everywhere except the brushes it would suggest a break in a field coil which is very unusual. No power to the brushes would mean no power to one of the field coils which would mean you dont have power everywhere. I suggest you begin dismantling and testing again.Please get it out. What causes this and how do I fix it. Skills range of abrasive blades highlights cutting blade technology supported by traditional production. These cutters edge last extended than cutting wheels in hard materials. 7 In Turbo Rim Diamond Blade. ProsDo you have a noncontact AC indicator You should Are you getting AC to the machine. Check built in fuse or breaker on the tool. Check the switch, does it feel and sound like it is switching correctly. Or is something differentIt he shaft is rotating while tightening disc, use shaft lock button on side of gear box.

Page 10 of your instruction manual. Here is a link DeWalt D28402 Instruction Manual Page 10 In my experience, they can stick, not allowing the leg to collapse. I have to keep them pushed in at the same time collapsing the leg. Look for any burrs or bending on the folding device itself, as it may have gotten bent during a move and needs straightened.Either the commutator needs truing on a lathe because its changing shape or else one or more of the armature coil connections have lost their connection because the solder has thrown off or they have broken from the commuter segments.
