

## FAILSAFE

When you bind your transmitter, you are programming the receiver with failsafe defaults. If connection is lost between the transmitter and receiver, the receiver immediately operates in those preprogrammed default positions. Those positions are failsafes. The AR8000 has three failsafes: SmartSafe Failsafe, Hold Last Command Failsafe, and Preset Failsafe.

### SmartSafe Failsafe

SmartSafe is a safety feature on the throttle channel only that offers the following benefits:

- Prevents electric motors from operating when the receiver only is turned on (no signal present).
- Prevents the speed controller from arming until the throttle is moved to low throttle position after connection is made.
- Shuts off electric motor and reduces gas/glow engines to idle if signal is lost.
- If throttle is at any position other than low, the ESC won't arm.
- If connection is lost in flight, SmartSafe sets the throttle to the position it was in during the binding process.

### How To Program

SmartSafe is automatically set when the receiver is bound. **NOTE:** You must put the throttle stick in the low position to store low throttle during binding.

### To Test

Confirm the failsafe setting is correct by turning off the transmitter. The throttle should go to the preset low throttle position. **CAUTION:** Make sure the aircraft is restrained on the ground. If failsafe is not set, your aircraft might advance to mid or full throttle.

### Hold Last Command

If you lose connection, all channels except for throttle channel hold last given command and the aircraft continues on its path. So, if you were turning when connection was lost, your aircraft would continue turning.

### How To Program

1. Leave the bind plug in the bind port through the entire binding process.
2. Remove bind plug only after receiver connects to transmitter.

### To Test

Confirm the failsafe settings are correct by turning off the transmitter. All channels except for the throttle should hold the last command.

**CAUTION:** Make sure the aircraft is restrained on the ground. If failsafe is not set, your aircraft might advance to mid or full throttle.

### Preset Failsafe

If the signal is lost, all channels are driven to their failsafe position set during binding. Preset Failsafe is ideal for sailplanes, as spoilers can be deployed during loss of signal, preventing a flyaway.

### How To Program

1. Insert the bind plug and power on the receiver.
2. When the receiver LEDs blink indicating bind mode, remove bind plug before binding the transmitter to the receiver.
3. LED lights will continue to blink.
4. Move transmitter's control sticks and switches to the desired Preset Failsafe positions then turn it on in bind mode.
5. The system should connect in less than 15 seconds.

**NOTE:** Failsafe features vary according to receiver, so if using a receiver other than the AR8000, consult your receiver's instructions for the failsafes that apply.

Before flight, ALWAYS confirm your binding is good and failsafe is set. To do this, make sure the system is connected, turn your transmitter off. Confirm that low throttle is active.

**CAUTION:** Make sure the aircraft is restrained on the ground. If failsafe is not set, your aircraft might advance to mid or full throttle.
