Other highlights include large 3inch LCD monitor, Face Detection, Motion Detection, RedEye Correction and iContrast Intelligent Contrast Correction system boosts brightness and retains detail in dark areas. You may find documents other than just We keep our list of direct Canon PowerShot SD880 IS Silver driver and firmware links uptodate so they are easy to find when you need them. The Canon SD880 also reduces the body height and thickness ever so slightly. The added magnification power is all found at the telephoto end, with the overall range varying from a useful 28mm wideangle to a moderate 112mm telephoto. As with its predecessor, the Canon SD880 IS includes true optical image stabilization to help combat image blurring due to camera shake. As well as the previously mentioned AF tracking, the Canon SD880 ISs autofocus system now has improved face detection capability. Canon says the camera will now recognize faces at most angles, and has included a Face Detection self timer which automatically takes a photo two seconds after an additional face enters the scene. The Canon PowerShot SD880 ISs LCD display has identical size and resolution to that in the previous camera its a 3.0inch design with 230,000 dots, but Canon also claims higher contrast. A new high sensitivity scene mode allows this to be boosted to a maximum of ISO 3,200, however. Metering modes are unchanged evaluative, centerweighted and spot all being offered. Likewise, the Canon SD880 is much like the SD870 in that it offers only a program mode, with no options for aperture or shutterpriority shooting, let alone a fully manual mode. Flash range when set to Auto ISO is rated at 1 13.8 feet 30cm 4.2m at wide angle, and 1 6.6 feet 30cm 2m at telephoto. There are sixteen scene modes, and the Canon SD880 also offers a new Intelligent Contrast Correction function. As with the previous camera, sound is recorded along with movie clips.

The Canon PowerShot SD880 is unchanged from its predecessor in storing its images and movies on

Secure Digital cards, and includes a notverygenerous 32MB card in the product bundle. Power is likewise unchanged, coming from a proprietary NB5L lithiumion rechargeable battery. And Canons PowerShot SD880 IS will make your heart skip more than a beat, not only with its very attractive shell but with the best button layout ever seen on a PowerShot. Oh, and the photos arent bad either. You wont regret a longterm relationship with this ELPH. That combination of function and style makes the Canon SD880 IS even more attractive than its fellow ELPHs. But the Canon SD880 will slip into a pocket or purse without a problem and includes a tasteful black wrist strap to retrieve and secure it. Like most digicams not parading as bargain cameras, it has a 3.0inch LCD thats a pleasure to look at even in direct sunlight. Type on the menus is sharp, clear and large. And images in Playback mode look great. Gone are the tiny round pinheads surrounding the Control Dial that pass for buttons on other cameras. In their place are big, asymmetrical buttons that follow the curve of the short edge of the camera body. Theyre a delight to press, too. There is a little grip area on the Canon SD880 for your thumb indicated by some raised triangles, but it made one companion complain that the camera is too small. That isnt always the case, but it should be. To turn the Canon SD880 on in Record mode, a triangular button partly obscured by the large Shutter button does the job. And the black Zoom ring surrounding it is my preferred zoom control buttons on the back dont cut it. The red legend is silkscreened on the dark brown back panel making it very hard to read. There are only three positions, though, so you can memorize them Movie, Scene, and Still. Digital zoom is also 4x, giving you a 16x range. Macro focusing gets as close as 0.

8 inch at wide angle and was one of the true joys we had shooting with the Canon SD880 IS. And the same can be said for its barrel distortion at wide angle. Telephoto showed none. Its there, as it is on almost every digicam, but not excessive on the Canon SD880. Thats a big help when shooting telephoto particularly when using digital zoom but its also a great way to avoid shooting flash, giving you more shots in low light than a nonstabilized lens. And switching modes is as simple as pressing either the Shutter button or the Playback button with the camera already on. Its a disappointment if you expect any kind of manual control over the Canon SD880s aperture and shutter speed. Its a consolation if you dont want to know what thats all about. Auto greatly restricts the options available on the Canon SD880. ISO, for example, can only be set to Auto or Hi, not any specific setting. And Continuous Release mode is not available. Nor are things like White Balance or Exposure Compensation EV. All of these are available to fiddle with in Program AE. Movies can be either 640x480 or 320x240, both at 30 frames per second. Zoom is restricted to the silent digital zoom but you can set the optical zoom before recording. The Function menu sets Exposure Compensation, Long shutter, White Balance, My Colors, Metering mode, Compression, and Resolution. All other functions, which affect general camera behavior, are set via the Menu, accessed from the Menu button. Though it ships with a 32MB SD card, youll want at least a 2GB or 4GB card for practical use. An EyeFi card turns the Canon SD880 IS into a WiFi camera and can even add GPS tagging to it. The same card will record 23 minutes 49 seconds of 640x480 broadcastquality video. An AC adapter kit is also available. Canon estimates battery capacity at 310 shots with the LCD on the only way to use the Canon SD880 IS using CIPA standards which shoot 50% flash shots.

You just turn them on and fire the Shutter button, maybe tweaking composition by nudging the Zoom ring one way or the other. Thats all you have to do, really. You dont see it, but you enjoy the benefits of it. Face Detection is one example. Some schemes only recognize faces looking at them, depending on the triangle of the eyes and nose to identify a face. But Canon claims it can find a face thats not looking at the camera. Tired of setting the selftimer and dashing around the camera to get into the scene. The Canon SD880 ISs Face SelfTimer waits for you. It recognizes your face and wont fire the Shutter until youre in the scene. The iContrast function is available when shooting or can be

applied to a captured image in Playback mode to adjust contrast automatically. It failed to find focus when I shot the avocado plant in the gallery but I didn't use Macro mode, thinking I was far enough away. Even in Macro mode, though, the Canon SD880 IS struggled to find focus on the Lilies of the Field. I just could not force the camera to focus on the part of that shot I wanted. The poppies and the carpenter's pencil show just what fun you can have shooting macro with the Canon SD880 IS. I shot a friend who brought over a pizza and some chicken soup at way too slow a shutter speed to freeze him as he ducked out of the frame. But the image still appeals to me. It's so saturated that it looks unreal. That same quality, however, is probably what makes the flowers so attractive. And most of us shoot more flowers than fire alarms. See below for our image analysis and conclusion. Compared to others in this class, this lens has less softening than most. At telephoto, the lens is very sharp across the frame. Very good performance for a wideangle zoom. At telephoto, distortion is also moderate, but less noticeable because pixels aren't as bright. There's also a small amount of visible chromatic aberration along the print lines of the dollar bill. Minimum coverage area is 1.17 x 0.

87 inches 30 x 22 mm. The camera's flash is blocked by the lens at this close range, resulting in strong overexposure in the top left corner and dark shadows in the lower right. Some yellows have a greenish tint, and cyan is more blue, but overall results are pleasing. When it comes to skin tones, the PowerShot SD880 IS produces slight pink tints in the lighter tones, while darker tones are a little light and warm. ISO 800 shots are good, controlling chroma noise quite well, but getting softer. ISO 1,600 and 3,200 shots are very soft indeed. See Printed results below for how this translates when printed at different sizes on paper. Canon's own test calls for a range of 13.8 feet, exposed in Auto ISO mode, which raises the ISO to 320. At ISO 100 and telephoto, the flash starts out dim at six feet and gets worse from there. The telephoto test also produced good results at the rated 6.6 feet, though again, the camera raised the ISO to 250. The Manual option produced good results. Certain details are somewhat soft at this size when examined up close, but it's really quite an amazing performance from a pocket digital camera. ISO 200 and 400 images look better at 11x14 inches, but that's pretty impressive too. ISO 800 images show some graininess in the shadows, but very little chroma noise when printed at 8x10, again impressive. ISO 1,600 images are okay at 5x7, but better at 4x6. ISO 3,200 images are soft even at 4x6, and not worth printing. Prefocus speed is a very fast 0.079 second. The new, large controls on the back panel make it a pleasure to use and the new design easy to handle. And the wide angle zoom that now extends a full 4x into telephoto range will be appreciated whether you're trying to fit everyone in the room into the picture or get close to some distant landmark. The larger sensor and Canon's noise suppression technology make shooting at higher ISOs less disappointing than it has been in this pocket format.

The lack of an HD movie format competes with the lack of any kind of manual control. But there's some cool face detection technology that doesn't take a great effort to enjoy. But its image quality is what will turn that infatuation into a longterm relationship. And that's what makes the Canon SD880 a Dave's Pick. CanonHead over here. Please try again. Please try again. The cameras themselves are identical apart from the front fascia, according to the parts lists. The Canon model number on the bottom is consistent between marketing names. Images are recorded as JPEGs. Raw image files are not accessible without the use of third party firmware such as CHDK. Canon issued a recall in October 2006 adding these to their recall list. The damaged CCD displays purple or blueish, distorted or possibly no image at all. This problem can be temporarily overcome by removing both the main battery as well as the small internal battery. Canon has acknowledged this issue and formerly repaired free of charge. The reason given is its missing info about the video recording specifications and the PowerShot Digital ELPH 360 HS a successor to 340 HS model, which was also released in January 5th 2016, alongside 190 IS model. It has a 20.2 MP CMOS sensor with 12x optical zoom and 1080p FullHD video capabilities as opposed to ELPH 190IS model. My disappointment lies mostly with the build quality of the PowerShot SD990 IS; it produces image quality that's among the best we've seen of cameras of a similar ilk. This, coupled with a handful of other shortcomings, chips into the camera's excellent performance. The image quality is indeed outstanding. The PowerShot SD990 IS netted an overall score of Superior in the our lab's jury evaluations, producing some of the best results for color accuracy, lack of distortion, and exposure quality we've ever seen in a pointandshoot. We photograph a complex still life, a target resolution chart, and a mannequin to see how well each camera captures details and subtle coloring such as skin tones. A panel of judges reviews onscreen and printed photos and assigns image quality scores; we then average those scores.—Lab testing performed by Tony Leung Canon released the SD990 alongside the 10 megapixel PowerShot SD880 IS, its less expensive and excellent Digital Elph sibling. The PowerShot SD880 IS, though, feels as solid as a rock, despite the fact that it, too, has a plastic chassis. The dial makes scrolling through menu options extremely fast, but, on the PowerShot SD990 IS, it jiggles enough to make it feel flimsy. What's more, that dial is surprisingly difficult to use, with its secondary function switching between program mode and manual mode unhandy at best. When I was dialing between modes, I often couldn't make it land on the one I wanted. On the SD880, I never had such problems with the control dial. When I compared it to the SD880's 28mm to 112mm, 4X optical zoom, I started wondering why Canon skimped on the wideangle with this more expensive model. So what features make the PowerShot SD990 IS pricier than the PowerShot SD880 IS, other than the higher megapixel count. For starters, it has an optical viewfinder. It also has a wider set of manual controls, including aperture and shutter speed settings, flash exposure compensation, and manual focus.

In Quick Shot mode, the PowerShot SD990 IS continuously adjusts for exposure and focus even when you remove your finger from the shutter button entirely, thus eliminating shutter lag almost completely. The PowerShot SD990 IS's optical image stabilization is also slightly more powerful than

the PowerShot SD880 IS's. And it's available in black or silver. These include Servo AF continual focus adjustment for moving objects, "Intelligent Contrast" which increases dynamic range, and a fun facedetection timer. About the timer You set up the camera, hit the shutter button, and, as soon as the camera detects an additional face in the frame that is, once you jump into the scene, it starts a two second countdown before snapping three photos. And enough time elapses between shots to change positions, making this feature possibly even more fun than a photo booth. Compared to the "smile detection" functions used by its competitors, the facedetect timer wins hands down. Despite the improvements on its predecessor, I can't help but feel that Canon dropped the ball a bit with the PowerShot SD990 IS. Unless you simply can't live without an optical viewfinder or extensive manual controls, I see little reason to spend the extra bucks on the PowerShot SD990 IS.
