I wanted something with full manual control of shutter speed and aperture and manual focus if possible, something capable of shooting in low light which means an image stabilized lens and high ISO capability, a decent zoom range, good image quality and a reasonable price.In the highest image quality mode, 4GB gives you just over 30 minutes of recording.

With higher compression you can get about 1hr of VGA video. The time limit for 160x120 recording

is 3 minutes. Sound mono is also recorded while shooting movies.The image stabilization system allows you to shoot in about 3 stop less light than you could without it. This is remarkably good performance.ISO can be set to 80, 100, 200, 400, 800 and 1600. Above ISO 400 noise becomes pretty noticeable and at ISO 1600 the automatically used noise reduction algorithm reduces image detail significantly as you can see in the set of 100% crops above. Ive seen other reviews which imply that ISO 1600 is so bad as to be useless, but I think thats too harsh a judgment. To me they looked pretty good, in fact probably better than prints I remember having made from ISO 1600 film some years ago. So although ISO 1600 images are noisy and details are soft when compared to shots at ISO 80, they are far from useless as long as you stick to small prints. The images below are 25% crops from the original image.Image quality is surprisingly good for a high MP camera with a small sensor. Below is an example shot at 80mm equiv and f4 using the camera default settings for exposure and ISO 80.On the right are 100% crops from the image center and the extreme bottom left corner.Sharpness can be reduced if you prefer to do your sharpening in Photoshop, where you have somewhat greater control over the parameters used. However the default values make excellent looking prints which is what really counts.This is a 100% crop from an image shot at f2.8 at 35mm ISO 80The image on the right above shows the effects of such correction.Optical viewfinders are becoming increasingly rare on digital cameras, but the A720 has one which zooms with the lens from 35mm to 210mm. It only shows about 80% of the frame and theres no diopter adjustment, but its perfectly fine for aiming the camera and it can more than double the battery life if you turn off the LCD.

Of course you cant really turn off the LCD since you need it to adjust the camera settings, but you dont need it on all the time. Ive seen similar behavior on other Powershot cameras and I dont really know why there is this limit, but just be aware of it. Its not a problem since if you really want a long shutter speed, just switch to Tv or M.This is because the senor is so small that if you could stop down to aAll small sensor digicams are like this, its the nature of the beast.In manual mode there are three power levels, minimum, middle and maximum. With a fixed flash power output you control flash exposure via the aperture and ISO settings you chose. Using a flash meter I measured the maximum flash output GN as 16 ft, ISO 100. In M, Av, Tv and P modes you can manually set the flash to 2nd curtain sync. In manual mode you just get one flash, so you could use it with a traditional optical slave flash. In auto mode the flash emits a metering preflash, so you need a digital aware slave which fires only on the main flash, not on the preflash.A scale is displayed in ft or m, though its not very exact. It does show you where you are within the focus range though. There are two scales. One runs from 50cm to infinity with marks at 1, 2, 5m and infinity. If you close focus the scale switches to 0 to 50cm with marks at 10, 20 and 50cm.There are a number of autofocus modes on the A720is. You can let the camera select from 9 AF zones which cover the whole image AiAF mode. You can select the center focus zone only. Theres also a Face Detect mode which focuses on faces and adjusts exposure and flash for best exposure.The A720is has a full set of white balance mode Auto, Daylight. Cloudy, Tungsten, Fluorescent, Fluorescent H, Underwater and Custom. In custom mode you can take a shot of a grey card or a white card and use that to set a custom white balance for future shots.Some can be changed, though most are fixed.

For example, in most of the program modes you can change the drive from single frame to continuous shooting or delay timer and you can set the image resolution and quality, but you cant change the metering pattern, flash exposure compensation, white balance, saturation, sharpness, contrast or ISO setting.Three metering patterns are available. Evaluative metering takes data from multiple zones. Centerweighted metering takes an average reading weighted for the center region of the image.The screen shows a histogram and fairly complete shooting data including shooting mode, shutter speed, aperture, ISO setting, exposure compensation, white balance, as well as data on the image size, compression, date and time. Overexposed areas flash as a warning.The above image shows the camera was in Program mode, set to ISO 1600, image stabilization was active and the

camera was in macro focusing mode.The A720is uses Secure Digital SD memory. SD cards are limited to 2GB, but the A720is can also handle the higher capacity SDHC cards. Canon supply a pretty useless 16MB card with the camera, which is enough to store 3 images at the highest quality, so make sure you buy a larger memory card when you buy the camera. You can also use MMC MultiMediaCard cards, though I dont know why you would.The lower the compression the larger the files, but the higher the image quality. The A720is cannot store images in RAW format in common with most other current Canon digicamsIn this case just two of them. Canon say that you should get about 140 shots from a pair of alkaline AA cells with 50% flash usage and the LCD on. With the LCD off this goes up to 400 shots. Using rechargable 2500mAh NiMH cells you should get around 400 shots with the LCD on or 900 with it off. Though Canon dont specify what to expect from Lithium AA cells, I suspect you might get almost double the numbers for NiMH. This is pretty respectable performance.

The advantage of using AA cells is that if you do run out of power unexpectedly, you can find alkaline AA cells in almost any general store in any part of the world.You do get a little time after the warning, but not all that much, so it would be advisable to carry a spare set of batteries with you.A minor point, but the tripod socket is located on the left hand side of the camera base, not on the optical axis of the lens. Technically this means that if you use the camera on a tripod and take a series of images to stitch together, youre not rotating about the right axis. Even with the mount in line with the lens, youre still not quite at the right point, but you are closer. In practice this probably isnt going to be a big problem, but its something to be aware of. The biggest difference is in the thickness of the camera. However this grip section makes it MUCH easier to shoot one handed since it allows you to get a firm hold on the camera. You can easily slip the A720is into a jacket pocket and it even fits in the pocket of my jeans without too much trouble. The SD series cameras, while small, dont have the extensive manual control features of the A series cameras, so you have to chose between size and flexibility.The Powershot A720is is a remarkably capable camera with extensive manual options. Theres very little you cant do in the way of manual control as long as you select the correct mode. Of course you can also operate the camera in fully automatic mode if you wish. The lens quality is good and the zoom range is useful. There can be a little purple fringing of very bright areas, but its not excessive and its something seen in just about all cameras of this type. The image stabilization system is very effective. Focus and exposure are consistently good. Extreme highlights occasionally blow out, but thats indicated on the histogram display and is easily corrected by shooting again with a little negative exposure compensation.

These new cameras seem to have most of the features virtues of their predecessors, plus a higher pixel count and a slightly slimmer shape. You can read a brief preview of the new models HERE. If I was looking for an A720is which Im not since I already have one!, Id now consider the A2000is. Id also take a close look at the new SX110is, which has a longer 10x lens. Learn More What with the popular and fashionable IXUS range, the very successful range of digital SLRs, the wonders of the S5 IS superzoom and the semipro PowerShot G9, not to mention the new SX100 IS, the poor old Aseries has been a bit overlooked of late. In fact the last Aseries camera I reviewed was the excellent A570 IS, back in June. Naturally things have moved on a bit since then, and included in Canon's Autumn collection was the PowerShot A720 IS, an 8megapixel, 6x zoom camera with optical image stabilisation, an optical viewfinder, 2.5in wideview monitor and a range of manual exposure options. It's sold exclusively through the Jessops chain here in the UK, but is available from a wider range of sources elsewhere in the world. If you're looking for a midsized compact with a decent zoom range, a high quality lens and a good range of features including manual exposure, then you're going to end up with either a Canon Aseries, one of Fujifilm's Sseries cameras or possibly a Samsung NV7. There really aren't any other serious alternatives. Even given that choice it's hard to compare he A720 IS with anything else on the market apart from another Canon. The A720 IS is currently the secondfromtop model in the A series. After this it's the 12megapixel A650 IS which has

been delayed by technical problems, the SX100 IS, and then you're into the S and G models, which are a lot more expensive. From that perspective the A720 IS looks like pretty good value for money. The body is made from plastic, but the build quality is up to Canon's usual high standard.

It does emit a few creaks when given a good squeeze and there are a few areas on the body that do flex slightly, but it feels reasonably robust, and the fit and finish of the controls and other external features is very good. The tripod bush is plastic, and is located right at the far end of the base plate, which could cause a few problems, but at least it means you can open the hatch when the camera is fitted to a tripod. The camera is somewhat larger than most pocket compacts, measuring 97.3 x 67.0 x 41.9 mm, and weighs around 250g including the pair of AA batteries that supply it with power, so it'll take up a lot of room in your pocket. All of the controls are gathered on the righthand side of the body, and positioned for easy onehanded use. Playback or capture modes are selected by a simple slider switch on the upper right, zoom control is a rotary bezel around the shutter release, while main shooting mode selection is via a large knurled dial on the top which can be turned with the thumb. The A720 ISO has a good range of shooting options, including the shutter priority, aperture priority and full manual exposure modes that will appeal to more experienced photographers. This is a much wider range of control than many compacts that offer manual exposure. There is also a scene mode that offers a further seven special programs, including an underwater mode for use with the optional diving case. The video mode is fairly standard, offering VGA resolution at 30fps. The A720 IS has Canon's usual function button menu, providing quick access to most commonly used shooting options, including ISO setting, white balance, colour mode, flash output, metering mode, compression quality and image size. It is much the same selection as is offered by most of Canon's compact camera range, and is more than enough to cope with most situations, as well as providing some welcome creative control.

The main menu offers even more options, such as a range of focusing modes including face detection, AiAF, centre and flexible positioning. Flash sync can be set to first or second curtain, and there are monitor grid overlays for both ruleofthirds and 32 composition. The image stabilisation can be set to operate continuously, only on shooting, or limited to vertical stabilisation only for panning shots. One omission is variable noise reduction, but you can't expect too much from a sub200 camera. It is advertised as having a wide angle of view, and they're not kidding. The image on the screen can be seen clearly from almost any angle, making it ideal for holding the camera over your head at concerts, and for showing the resulting pictures to your no doubt admiring friends afterwards. Compact cameras that have viewfinders are something of a dying breed, and often the viewfinders they do have are so small as to be virtually useless, but the A720's finder is actually very good. It is nice and bright, with good optical quality, is mechanically linked to the zoom lens, and provides about 80 percent frame coverage. It is a good alternative to the monitor if you want to stretch your battery life as much as possible. It starts up in well under two seconds, and takes about another two seconds to shut down again. In single shot mode at maximum quality the shottoshot cycle time is also around two seconds. The flash is a little slow to recharge, taking between six and eleven seconds per shot depending on the situation, but it makes up for this with excellent exposure control, especially at close range, and a wide angle range of approximately 3.5m at ISO 200. In continuous shooting mode the A720 IS does very well, shooting at a consistent 0.7 seconds per shot, which it appears to be able to maintain until the memory card is full.

According to the information on the monitor, a freshlyformatted 1GB SD card is enough to hold 286 pictures at maximum size and quality, but I suspect that the actual figure may vary by quite a lot. The A720 IS has about the widest variation in JPEG file sizes I've ever seen, with photos taken at the highest setting varying from 2.4MB to 6MB depending on the content, although the average of around 4MB for a typical scene is about what I'd expect from a good 8MP camera. My test sample was supplied with a pair of standard industrial alkaline batteries which faded out after about 150

shots, which is pretty much what Canon states in the camera's specification. If you're considering buying an A720, I'd suggest buying a couple of sets of NiMH rechargeables and a charger as well. The 6x zoom lens is particularly good, providing a huge amount of fine detail with good edge sharpness and very little barrel distortion at wide angle, although there is a little pincushion distortion at the telephoto end. Noise control is also well above average, with very good image quality at 800 ISO, and usable results even at the maximum setting of 1600 ISO. All in all, an excellent performance from a very accomplished camera. Build quality, design and performance are all first rate, image quality is superb and the range of features is hard to match at the price. Battery duration could be a problem, but the ready availability of AA batteries offsets this somewhat. On this page the full size image at the minimum and maximum ISO settings have been reduced to let you see the full image, and a series of full resolution crops have taken from original images at a range of ISO settings to show the overall image quality." In some cases, the full size image has been reduced for bandwidth purposes, and a crop taken from the original full resolution image has been placed below it to show the overall image quality. Some other pictures may be clicked to view the original fullsize image.

Our library is the biggest of these that have literally hundreds of thousands of different products represented. I get my most wanted eBook Many thanks If there is a survey it only takes 5 minutes, try any survey which works for you. You might not need every tool for every procedure. What distinguish it from its predecessor are its improved sensor and image processor, namely, a notable increase in its ISO sensitivity as well as its ability to use face detection technology. The latter allows for higher quality portraits and other pictures with human subjects. Something went wrong. View cart for details. Sell on eBay Sell Digital Cameras User Agreement, Privacy, Cookies and AdChoice Norton Secured powered by Verisign. Overall the images still look okay but a close look at any of the detail shows that luminance noise is starting to add a slightly grainy appearance to things. There isnt much in the way of chroma noise the black areas have remained neutral, for instance. However, the level of detail is considerably lower than in the ISO 80 shots, showing that the low levels of chroma noise are the result of noise reduction averaging and smudging the colors to avoid odd patches of aberrant color.

That said, the A720 IS would produce a perfectly decent print at ISO 400 as long as light levels hadnt dropped too far. Be the first to write one! Read our full review to see why its got the best autofocus system weve ever seen. 716 Olympus OMD EM10 Mark IV initial review first impressions Aug 4, 2020 at 0600 The Olympus OMD EM10 IV is the companys entrylevel DSLRshaped mirrorless camera. While it has a higher resolution sensor and new processor, its biggest focus is on selfies. 2258 Sony a7S III initial review Jul 28, 2020 at 1400 The Sony a7S III is a 12MP fullframe camera primarily designed with video in mind.
