Get maintenance and service guide. Turns out my "won't boot; blank screen" nx7000 just needed the VGA cable reseated. Having the manual made it that little bit easier. Magic! Strange that the vid card would stop the whole thing booting, but hey, now I've seen it with my own eyes!

It works for a bit and then fails in a similar fashion or by showing video artefacts which then crashes the machine anyway. I can't work out exactly what's wrong because the slightest pressure or movement causes it to fail. Its a few years old now but hasn't been dropped off a cliff recently so what gives. VERY annoying, any other suggestions apart from a hammer or super glue!!p I have a zv6000 and the screen is almost black except for a slight image, I've attached an external monitor and the video works fine. So, I just received a replacement inverter. I'm ready to jump in but the HP manual doesn't show how to take apart the LCD only how to remove. Last year, I accidentally spilled water on it. It shut off by itself, but somebody turned it on immediately, it shut off by itself again. Then it won't boot. I took the laptop apart, blew dry all the parts, and put them back together. It boots, but only when the battery has power in it AND the AC adapter is NOT plugged in. Isn't that weird! I found the light on the AC adapter was off by itself, and then the battery was drained. That was why the laptop was off. But I really had a very hard time turning it back on. Somehow the battery had a little power left, just enough to turn it back on, and within literally a second I plugged the AC power in and started charging the battery. But I am very annoyed by the fact that if the battery goes bad eventually, the laptop will be useless. What possibly went wrong. How can I fix it It's hard to guess what is wrong without testing the laptop with a known good keyboard. Most likely

it's just a bad keyboard, but it's also possible that the keyboard controller on the motherboard is bad not very common. I would try replacing the keyboard, you have a good chance to fix the laptop.

I took it to the shop, but since I'm overseas, they were very unexperienced, and weren't quite sure what to do, told me I'd have to buy an entire new laptop keyboard similar to it for 1000 sr, which is really really expensive and won't come for 2 weeks, I dunno what's the deal. It's still under warranty, but the warranty isn't honored in a different country, only the country you bought it in, unfortunately. With both the power cable plugged in and not plugged in, it doesn't boot. It has power as indicated by the power light, but that is all it does, power on. The hard drive does not power on, and the DVD ROM acts like its going to then stops, and repeats this over and over. It initially beeped twice when it was first powered on, but after removing and reseating the ram that stopped. As it sits right now there is nothing but one stick of ram in it, no HD, no DVD, the needed hardware to get it started. I'm stumped at this point. Also odd note, compaq says these are all intel, but this one has a Mobile Sempron Sticker on it. Any ideas Maybe one memory slot on the motherboard is defective. Also, find a test the laptop with a known good memory stick. While I need to read my USB Saver 512 Mbyte, I have to restart the Laptop every time. Would you please to help me to solve this problem. Thanks a lot, Mehran Or is there any modification on the wiring needed I resoldered the connector, but now the machine won't boot. Thanks to learning a bit from your site, I tried to systematically find out what was wrong. At this point, the memory modules were the only other thing plugged in. Result Fan starts up for 5 seconds or so, and turns off. Screen dark. Result Same as 1. Then the drive stops also. Result Same as 1. Result Same as 1. I started trying the buttons for the status display on the front edge and found that with an audio CD in the optical drive, I could get the display to show that it was trying to play the CD.

That is, for example, to display would show it going to the first track and would start timing, as if it was playing the track. The CD itself with spinning in the drive. I tried putting the speakers back, and the little board that has the external volume and audio on off buttons to see if I would hear music. There was no sound. I'm pretty aware of precautions necessary to avoid static damage, so I don't think it's likely that that is what occurred. I'm also confused by the symptoms with the CDs that I described, because I don't know the relationship between that kind of CD playing from the front panel, with the computer off and the rest of the computer. At this point, the memory modules were the only other thing plugged in. Screen dark. Check if the video cable is properly connected to the motherboard. If the video connector on the motherboard has pins inside, make sure there are no bent pins. Check if the memory module is seated properly, move it into another slot and test the laptop again. If for some reason you removed the CPU during disassembly, make sure it's seated properly and LOCKED inside the socket. I have tried everything i can think of an i am still unable to connect to the internet. Router works fine. just can't get on the net. Do you see any yellow exclamation mark in the wireless card entry. Try reinstalling the driver. Try reseating the wireless card, just remove it from the socket and install back in place. Make sure the wireless connection is not disabled. I cannot give you 100% remedy for this problem, there could be many different hardware or software related issues. After I pushed on the power button, fans started spinning and were active for a few seconds, LED is on, but my laptop still blank not display any thing and not working, no beep sound. If you have two modules, try removing them one by one and test the laptop with each RAM stick separately.

If you have only one module and reseating it doesn't help, try replacing it with a known good memory module. It could be just a bad RAM. After I pushed on the power button, fans started spinning and were active for a few seconds, LED is on, but my laptop still blank not display any thing and not working, no beep sound. If you reseated the memory module and it didn't help, try replacing it with a known good RAM. If you have two memory modules installed, remove them one by one and test the laptop with each module separately. It is possible that one of the modules is bad. Just in case

try this. Unplug the power cord, remove the battery and wait for 23 minutes. Then plug the power cord and turn on the laptop. Sometimes it helps. It is necessary to open up the laptop and take a look at the motherboard. Do not use the laptop until then, you can make it worse. Take your laptop to a professional repair shop for diagnostics. Try reseating the memory modules first and if it doesn't help, test the laptop with a working memory module. Also, remove the hard drive and try starting the laptop without it. Sometimes a faulty hard drive can halt the entire system. If you get video on the screen without the hard drive installed, but no video with the hard drive, most likely this is your problem. When I move my LCD back and forth, my screen goes blank although my computer is working. I have to restart to start it working again. Recently I found out the the problem is the cable going from my LCD to the main board. How can i replace the cable I'm at a complete loss. The laptop "sees" your USB mouse, so most likely there is nothing wrong with USB ports. The laptop can play CDs and DVDs, so most likely there is nothing wrong with the optical drive or the motherboard controller. You can try this. 1. Using System Restore revert the operating system back to the time when it was working properly. If it doesn't help, go to the next step. 2.

Backup all important personal files and reinstall the operating system from scratch. My screen would go out if the screen was moved but you could still see it a very little bit. Hope this helps. Does not turn on at all at present. Battery charging light does not come on. Tried with memory, without memory, different slots, different memory. Nothing happens! Its a new battery it did manage to charge it a bit once when it was turned on, and stayed on for a hour or so but also tried the original old battery. Its also a new psu, which is putting out 19v with the right amperage for that model. When it did power up, it worked fine until it turned off instantly after a random amount of time. Nothing happens when power button pressed. Tried leaving it unplugged, without battery for hours, no joy. Tried removing the bios battery, and leaving it unplugged for ages, before putting battery back. No joy. Any suggestions Remove the battery and start the laptop from the AC adapter. Does it work from the AC power Can some one please be good enough to advise me how I could find it for my laptop. Thanks I want to take apart the keyboard and check that specific key. After taking out and disconnecting the keyboard, the underside has a clear plastic cover which is bonded to the main board of the keyboard. The small screws which I suspect have to be removed to completely disassemble the keyboard are covered by this clear plastic shield. My question is, should I expect any complications when I take out the plastic cover and remove the screws to disassmeble the keyboard Just search for "HP ZE5400 keyboard" I would recommend to contact the seller before buying the keyboard, just to confirm that you are buy the right one. Just search for "HP ZE5400 keyboard" I would recommend to contact the seller before buying the keyboard, just to confirm that you are buy the right one. What is wrong From your description I would say that you'll have to replace the screen. Try reseating the memory module.

If you have two memory modules installed into your laptop, remove them one by one and test the laptop with each module separately. It will help you to find out witch memory module is bad. I don't have anything cracked underneath, from what I've seen so far, but I don't know if this is something I can fix. Did it just crash and is done Set the BIOS to default, if there is such an option. Run Hitachi's drive fitness test to test the hard drive, I linked to this utility in "Resources". The scratch is not too deep but you can see the scratch it you look close. It just simply acts as if there is no hard drive attached, even the replacement hard drive I purchased is not showing up in the BIOS area. I just have tried not to open it up any longer till I find out some other good suggestions. You are appreciated! When I try to turn on the laptop it don't boot up but power led is on. Screen is black. I noticed that when my processor isn't in socket and I try to turn on laptop it of course don't boot up but all the two fans spin out. When the processor is in socket the two fans don't spin out. It seems that there is some kind of problem with my processor and this is the reason my laptop don't boot up. Some time ago my laptop boot up after many times of trying to turn it on. But now even acces many times don't help. Same problem as Damian. Nx7000 no boot. used he manual to disassemble, and

found all i had to do was pull up the LCD plug, and put it back down. Put off buying a new laptop for a while I hope It's necessary to open up the laptop and take a look under the keyboard to find out if water got on the motherboard. Is there any solution to this problem or how can i reset the bios on my laptop I have not been able to get any manual that shows disassembly. The back of my notebook seems to still be attached by the fan. I have removed all the screws I can find. I have not been able to find a clip or anything to releases it.

I have keys that were not working so I removed the keys only to find a lot of crap. What does it look like. Is it a 2032 battery. Appreciate any help. Thanks. Ed What does this mean. Because I am unable to get on my computer. Please let me know, so I can fix it. Thanks Can you see the hard drive in the BIOS setup menu. Check solutions posted at Microsoft TechNet. They mention three different methods to fix this problem. I am writing again. When I try to turn the laptop on, it doesn't boot up but power led is on. Screen is black. I noticed that when my processor isn't in socket and I try to turn on laptop, it of course doesn't boot up but all the two fans spin out. When the processor is in the socket the two fans don't spin out. Maybe it's useful information. But now even acces many times don't help. Could be just bad RAM. Try replacing memory, install another known good module. Try reseating memory, maybe it's not making good contact with the slot. I tried looking at the service manual, but there wasn't one. Getting to it is a pain, but can be soldered onto the auxillary board. Thanks again. Bruce After reading some of the appropriate materials, I think I've narrowed down my laptop's problem. The machine has a very checkered past already had to fix the power supply, heating system, broken "on" switch, etc, but it's very nice when it works. Right now, I'm having a problem where when I try to turn the screen on, the screen remains blank, and the computer beeps twice quickly before resetting. Could there be something else wrong with the machine. Thanks so much. I just looked at the laptop maintenance and service guide and it looks like you can access both memory slot from the bottom of the laptop, simply removing the memory door. How many modules you have installed. If you have only one module, try moving it into the empty slot. Test the laptop and find out if the problem is gone. Try replacing it with another working memory module.
