4" Screen, Turion AMD Processor, and 250GB Hard Disk. Empowered with 4GB RAM, and CDRW Optical Drive, this Compaq Presario F700 Refurbished Laptop proves the best business companion. Hello, I have a Laptop I am working on for my brother, who is in the Navy. When I received it, that hard drive was corrupt, and he had nothing he wanted saved, so I just went ahead and wiped it and reformatted. I reinstalled Windows Vista without much of a problem. I just finished all of the available updates. Hello all, and sorry for bringing this old topic up, but I have an exact problem, with the very same laptop here. Laptop boots up with freshly installed Windows 7, but it doesn't show any sound controllers. Also DVD drive is not being recognized at all, and it has a strange video problem when it boots into. Laptop repair tools 12. Disassembly tips for beginners The guide might work for some other Compaq and HP models. I think the disassembly steps will be very similar for Compaq Presario F500 and HP G6000 notebook PC. If this guide works for your notebook, please mention the model name in the comments below. Remove both covers. Remove the hard drive. I used Crucial DDR2 PC6400 memory modules. In system properties I can see 3.19GB total RAM reported. Most likely if you install a 64bit OS, you can use all 4GB. Please leave a comment. Remove two screws securing the wireless card in the top left and right corners. Pull the wireless card from the slot and remove it. Green screws securing the keyboard. You'll have to work with your fingers to disengage small plastic latches holding the switch cover. Before you pull the cable and remove the keyboard you have to unlock the connector. Now you can pull the cable and remove the keyboard. Release the wireless card antenna cables. Pull them through a hole in the motherboard. Remove four screws securing the display panel. In the next guide I will explain how to access and remove the LCD screen with inverter board.

Disconnect the power button board cable. Disconnect the touch pad cable. Remove two hex studs located close to the memory slots. You'll have to work with your fingers to disengage plastic latches securing the top cover. There are two more cables to disconnect. Now you can access and replace the cooling fan if you have to. You can access and replace the processor if you remove the heat sink. I was the the two hex studs that I didn't notice. Simple things like that, how ironic is that. Thanks anyway. This is a great resource for me. I repair PCs but hardly ever have to disassemble laptops usually Windows OS probs. I'm going to bookmark this site for the future, you guys will be my first resource. Thanks again. I do thank and appreciate your excellent work. And you happened to pick the exact laptop I own. But, what about the fan and heatsink. These are what I need to replace on mine now I believe. Oh well I'll just try and dig a bit deeper. Oh well I'll just try and dig a bit deeper. In order to remove the cooling module you'll have to remove the motherboard first. If you can remove the motherboard, replacing the heat sink with cooling fan shouldn't be a problem. If you could send me instructions or publish photos i would appreciate it GREATLY my LCD flickers when i open and close it. Just went to your home page its like the second post you have on there from the top lol If you can help me greatly appreciate. Go from Step 17 to Step 1. I've got the same model as

the computer in your picture and it just won't load. I'll press the power button and the lights will turn on, the screen will flicker, and the fan will start turning, but after 5 seconds or so, it'll just shut off. Then it'll try to turn on by itself, but the same thing happens. Is there something I can do to fix this Before you do that, make sure it's not the power adapter failure. You can test adapter with a multimeter. Did either one of you figure out how to fix it.

I had a friend suggest it might be a fuse on the motherboard. Like you, I don't want to dump a ton of cash at geek squad as they will tell you the motherboard is deceased. However, I want to fix rather than buy a new one given the current economy and the relative newness of the machine. Any and all help will be appreciated. Thanks a million. It's been collecting dust for months and I've tried all sorts of attempts to solve it and wondering if I should replace the motherboard. I don't suspect the power board is the culprit HP is the dirty culprit, really but please post any findings here; I'll do likewise. When the AC adapter cable is plugged in the lights are on as they should be. However, when you press the power button, the blue light on the power button comes on for 2 seconds and then goes out. Nothing else happens no fans spinning no disc spinning nothing. ANY ideas on what might be causing this. I'm thinking of replacing the fan to see if that does anything. I'll post here if I get it working. I know laptops aren't normally meant to be upgraded but I'd still like to take a whack at it. I managed to solve that problem by putting RAM in to a single slot instead of both the slots. Hope this should work on Compaq too. After that then the screen just wouldn't turn on and I haven't gotten my desktop monitor to work with it either. Could you tell me how to repair this problem Make sure the adapter outputs correct voltage. It's possible that your adapter is dead and the battery doesn't have enough charge to start the laptop. Replace the adapter if needed. 2. Could be memory related problem. Try reconnecting memory modules. Remove them one by one if you have two modules installed. Test the laptop with each memory module separately. If it's not AC adapter or memory, most likely you have a problem with the motherboard. It's the one in step 12. Thank you so much if you can help. I have looked everywhere.

If this connector doesn't have the locking clip like keyboard connector has you simply pull the cable from the connector. No audio output device is installed. No audio output device is installed. It's hard to tell if your problem is hardware or software related. Back up all personal files and reimage the hard drive from the recovery disc. Running the recovery disc will reinstall everything back to factory defaults. If you still missing sound even after running the recovery disc, it's definitely a hardware related problem. It just stays where it is just a black screen. Even if I turn it off and turn it back on it's the same way. Or if I wait for even half an hour it does nothing. Did the screen burn out. I have the Compaq f700. Can someone help me. I don't want to take the whole thing apart, just the CD driver part to see if the cable came loose or something. Apparently fired IDE channel. There is not much you can do besides replacing the motherboard or using an external USB DVD drive. It has a similar set up to this laptop. I am replacing the LCD screen, but I am having trouble removing the keyboard from the laptop. I don't want to take the whole laptop apart. What do you suggest, and how do I do it I am replacing the LCD screen, but I am having trouble removing the keyboard from the laptop. What do you suggest, and how do I do it. I think you can replace the LCD screen without removing the keyboard. Try removing the screen bezel without separating the display panel. Take a look at the service and maintenance guide for Presario CQ50. The screen bezel removal instructions are on the page 59. Slowly the battery began to die and now it's dead so I have to use the cable always. Now it is beginning to lock up. Sometimes it boots and works for awhile but eventually locks up. I suspect the heat is involved. Is it worthwhile to check processor to see if heatsink is seated properly. Perhaps add some silver stuff can't remember what it's called between processor and heat sink.

Then a new battery. Thoughts Ideas I suspect the heat is involved. Take a look inside the heat sink assembly. It's possible that the heat sink is clogged with dust and the laptop overheats because of

that. You can blow off dust with compressed air. Clean the heat sink and test the laptop again. Why Did you drop the laptop. If not, most likely the heat sink is seated as it should be. It's called thermal grease or thermal compound. Your laptop is not too old and most likely thermal grease is still in good shape. By the way, listen for the cooling fan. Does it spin at all. Maybe the fan is dead The blue power button LED turns on for about 2 sec when pushed, and then it turns off again. Switched RAM, took out HDD, DVD, WIFI module, resetted bios took out the battery no change. I have checked the voltage output of power supply and it is 18.7 vdc right up to the terminal block behind the battery. I would like to check the battery voltage but I am not sure which of the 6 little knife blade connections is which. I have tried to remove the case on the bottom and I have removed the wireless card, the hard drive, the battery and everything I can find, but there is still something holding it together in the area of the fan. The whole back is loose except for the area around one corner of the fan which seems to be held with a screw from above possibly under the key board. I was an et in the navy and have worked on "stuff" my whole life but this has about stumped me. Any suggestions sure would be appreciated. I found that the cooling fan was full of lint and etc. Again, thanks in advance for any info. When i attempt to power on my laptop the blue power light comes on, i can hear the fan and hard drive attempt to start up. Then it goes quiet, remains that way with the blue light still on for about 10 seconds, then powers down on its own. It then attempts to power on again and repeats this process over and over again if left alone.

Ive tried manually restarting it many times but it has no affect. My online research thus far has been completly unhelpful with possible causes ranging from the mother board, to the hard drive, to the battery. I tried pluggin it in and starting it without the battery but still same result, so i dont think its the battery. It then attempts to power on again and repeats this process over and over again if left alone. My online research thus far has been completly unhelpful with possible causes ranging from the mother board, to the hard drive, to the battery. This is not related to the battery or hard drive, that's for sure. 1. It's not likely but possible that one of the memory modules is bad. Try removing memory one by one and test the laptop with each module separately. This way you can find which one is causing the problem. 2. Most likely I would say 95% you have the motherboard failure. You'll have to replace the motherboard. I mean it's okay, it was shipped to my door in less than 7 days and it was pretty cheap. I installed it and it seems to work windows runs. But it has the wrong Bios on it. It doesn't recognize my CPU, WiFi module and some keys are not working. So I downloaded the bios from the compaq website. But not matter what I try, it wont flash because the stupid flash program thinks it is the wrong bios file for the wrong PC recognizes the wrong bios on the board and wants to flash the same crap only on it. But it's not. I don't know how to use the swinflash.exe in vista to force it to flash. I have purchased a few things from Tiger Direct and they were fine and were reasonably priced, but I have not checked to see if they sell motherboards for this laptop. Any suggestions where I might get a good deal on a motherboard that would work right out of the box would be appreciated. Find the seller with good return and exchange policy. Sounds like it's do or die. Thanks Bill The laptop has not been charging the battery, but it would run off the AC adapter.

The owner stated that it would "shut down" on him while he was using it. I have not been able to reinact that symptom I don't think he understands that it hibernates, because if you let it sit, it shuts the screen off, but I have discovered another symptom. First thing that happened was the plug on the AC adapter came apart, the wire was weak and worn out and the plug was pretty much dangling. After I unplugged it a few times trying to diagnose it, the plug just came apart. I thought I had figured it out, but replacing the AC adapter doesn't seem to help. The laptop will run, but the battery never charged. According to Vista, the battery was charging, but the percentage would never go above zero. My first instinct now was that the battery must be dead, but I was wrong again. A new battery changed nothing. At this point, having the battery in it is almost worse than not having it. With the battery in, the laptop will never shut down, it only goes to hibernate because its trying to charge the battery, which never happens. I noticed that the HP battery checker was not working

either, so I reinstalled that from the utility and now Battery Checker will open, but lists an “invalid battery” for both the batteries I have for it. As soon as I take the battery out, the laptop works like it should. If it were my laptop, I wouldn’t care because I never take mine anywhere. I feel terrible that I already ordered a battery that didn’t fix the problem, and now it’s still not fixed. Is it possible that the power board needs to be replaced. The laptop still works, so I figured if that was the case, the laptop would not work at all. Any ideas I have not been able to reinact that symptom I don’t think he understands that it hibernates, because if you let it sit, it shuts the screen off, but I have discovered another symptom. New AC adapter, new battery and still same issue. Man, sounds like a problem with the motherboard.

Apparently the battery charging circuit is not working properly anymore. That would be my best guess. Of course, I assume your new power adapter and battery are good. Check the BIOS update. I know that on some Toshiba laptops had a similar problem and Toshiba fixed it with the BIOS update. Here’s something else you can try. Remove the battery, start the laptop from AC and then insert the battery while the laptop is on. It might shock the motherboard and the battery will start charging. I’m typing on a laptop with a similar problem right now Satellite X205. I know it needs a new motherboard, but works absolutely fine from AC with the battery removed. There is no way I’m replacing the motherboard in this thing. I really doubt that replacing the power board will make any difference. I think it’s just a board where the DC jack is mounted. I feel terrible that I already ordered a battery that didn’t fix the problem You shouldn’t. Without any test equipment I would do exactly the same. But when I’m not sure what the problem is, I always mention all possible needed parts upfront. Just talk to the customer, explain what’s going on. If he’s going to approve a new motherboard, make sure to include the power board price into your quote for a new motherboard. I would. I’m having another problem with it now that I’d appreciate your opinion on The WiFi switch on the front of the laptop has broken switch just slides easily as if it’s not connected to anything, naturally in the “off” position and I can no longer use the WiFi. I think I can probably find a new switch and replace it without too much trouble, but wondered if there might be a “workaround” or some other way to just bypass the thing. I don’t need that switch and would be happier without it, anyway. Thanks so much for your great site and the help! Mark I don’t need that switch and would be happier without it, anyway.
