From the advent of the first massmarketed personal computer in 1977 to present time, computers have steadily and successfully become a very integral part of daily human life. With time, the affordability, portability and usability of computers has also been on a constant upward trend, with single individuals owning multiple computers in the form of desktop, laptop, netbook, handheld and cellular devices. With the increase in use of computer technology and devices, the incidence of their breaking down has also increased. In this computer repair manual, you will find all the information you need to fix a computer. First we will talk about all the tools you need to prepare your computer repair toolkit. That would include both hardware and software tools that you would need to successfully troubleshoot and repair software and hardware issues. About 80% of all computer problems faced today by computer users are software related, which is why you will notice most of the material covered in this book is software related. When there is a hardware issue in a computer, we will talk about how to pinpoint the problem hardware component by running various tests using programs. When the problem is identified, you will then learn how to replace the malfunctioning or broken hardware components. Most of the hardware tools required for your computer toolkit can be purchased from any local computer store. Go to the respective software vendor's website by clicking on the provided links and download the computer repair software required to carry out repair jobs. So let us begin our journey into the world of computer repair. I assure you that it is not as scary as you think it is. <http://acwf-hrtc.com/userfiles/8760-3com-manual.xml>

However, the problem with repairing laptops is getting them apart. There are often screws hidden under stickers, special clips that need to be squeezed in a certain way and usually the laptop needs to be disassembled in a certain order. Of course, it helps if you have a Service Guide to show you how to get the laptop apart; but they are sometimes difficult to get. Because of this, I have created this small list of sites where you can obtain Laptop teardown guides. Official Sources These are some of the manufacturers that actually share their tear down guides. The majority do not. Many of these links contain other information about the laptop drivers, specifications etc., so look for either the "Maintenance Guide" or "Service Guide" on these pages. Of course, if you want to know how to repair laptops brand unspecific then I highly recommend Podnütz's Laptop Repair Videos. It is difficult to get service guides for many brands so if you know of any other resources, please post them in the comments below.

Especially when you have to tell a customer that several hours of work to disassemble and reassemble a laptop just to solder a power jack may not actually fix the problem because the motherboard is already fried. Do you charge a flat rate or by the hour. Do you give a discount on a failed attempt to fix it. Any recommendations" I always charge a flat rate. Once you start taking these things apart on a regular basis, it does not take several hours. Sometimes you do all the work and the computer still does not work, which is why I charge a diagnostic fee. This assures you get something for your efforts. Jeff Walker says June 8, 2010 at 1250 pm Bryce, I've been following your site for a while now and I just wanted to say, it's a Godsend. I don't know how you find the time to do it but your articles are always fantastic, timely and well written. Graham Rusk says June 8, 2010 at 321 pm I found this one for Acer laptops but they also carry other makes as well and they cover other peripherals such as printers ever tried to fix a printer I don't know who they are but their website is amazing for pdf manuals Arow says June 8, 2010 at 428 pm Extra Dell info I had a Dell Inspiron 8200 laptop that was not listed on the Dell resource page. Whenever I see a product page or info link, I try to pick apart the URL for tidbits of info, like the above solution, if I can't find one specific to my situation. It really is surprising how often it works. Ian says June 9, 2010 at 828 am Awesome. It seems like I have generally been able to make my way around them, but I will admit I have been stumped once or twice. You never know where some of these manufacturers are going to decide to put the last screw to keep it all together and screw with the technician's head. Great link library as always.That was a pain. We have bigger copier machines over here, too, so I'm sure I will run across worse eventually.EmergencyPCRepairs says June 9, 2010 at 539 pm Thanks for these, have book marked also Itzecko says June 9, 2010 at 349 am How about some resources for parts to repair these laptops that would be nice. Anyone has any suggestions. Computer Repairs Perth says June 9, 2010 at 759 pm Some of these laptops are like Rubik Cubes. Thanks for the links. Web Design LA says June 10, 2010 at 441 am Informative source, never ever possible to find out such resource, bookmarked. Jason Q says June 10, 2010 at 520 pm All the sites above are great and I have used a few my self to get knowledge and insight on repairing laptops. Although I don't have that much experience repairing laptops maybe like one model that I have worked with which was a Dell D600 I did a mother board replacement for a family member after it was found out that it wouldn't power on and that seemed to solve the problem. But the thing I want to say is if all else fails.

Many times on Ebay the sellers will sell multiple manuals on one DVD with Multiple manufacturing laptop companies including utilities.CD Computer Services says June 11, 2010 at 651 pm That is a useful collection of resources for disassembling and reassembling laptops.Needless to say,the more you work on laptops,the more you sharpen your skill. As others have commented, it might be also good to have a list resources for part purchases. They provide best customer care also.I think you have to charge some kind of fee, the owner of the shop always did free estimates. Problem is you tear down the laptop and discover the motherboard is bad so then the customer says no to the repair. Well then you have to put the laptop all back together again before giving it back to the customer of course. How much wasted time is that. I think it's one of reasons our shop went down the tubes. We work hard but then at the end of the day don't have any money to pay ourselves.

Could have really used those manual sites at that time, oh well. All Rights Reserved Close dialog Session expired Please log in again. The login page will open in a new tab. Noooooooo! They offer stepbystep Mac repair information for doityourself technicians who want to repair old Apple Macintosh computers. These documents also include Apple technical specifications, memory configuration information, and more. With a few common tools, these repair manuals are what you need to become your own Macintosh Repair Technician for classic Macs preIntel. The categories are the best I could come up with. Some things may appear in only one category but really belong in two for example, the combo manuals that cover some model of Mac and also a Performa based on the same internal hardware. So if you have a Performa, youll have to pick through these a bit. A nice option for lowbandwidth users. Thanks, Google! Many of these files are Maconly standalone apps, HyperCard stacks, etc. Make sure to get the Mac Plus one, NOT the SE or 128k version. Make a new folder and put the Mini vMac program in it. Its about 10 MB and will expand to 24 MB. The emulated Mac Plus should boot rapidly. They are all standalone applications, though HyperCard Player is included as well, just in case. HyperCard stacks operate rather like web pages there are buttons and text that you click to navigate. Visit the Mini vMac website for a wealth of information on what else you can do with Mini vMac. Go to Jags House classic Mac HQ for all the software and information you could possibly want for an old Mac including how to make a Mac Plus webserver! If you want to view any of Jags old HyperCard stacks, get em onto a disk image as per Mini vMacs documentation and drop that image into the window while running off the whoopis disk image then you can use HyperCard Player to view them. This

means you can plug it in wherever the computer normally sits, and you can disconnect it when you need to walk away.

The little disposable straps are annoying and tear or fall off too quickly. Even if you're working in a well-lit room, focusing extra light on where you're working will help you spot cracked solder joints and other tiny details. So I prefer the canned air with the little straw. But DON'T hold it upside down or it will squirt liquid! But if you're careful, Q-tips are sufficient. Rubbing alcohol is a good cleaning solution to use with electronics because it evaporates quickly. Regular rubbing alcohol is 70% alcohol with the rest being mostly water. The 99% leaves much less residue. They're invaluable for disconnecting delicate ribbon cables and lifting bent components as well as scraping corrosion off of small parts. It's a small brown squareish thing made of two halves fastened together with two rubber bands. It forms a donut with two indentations on the outside, and if you slide a screwdriver through the middle a couple times, it becomes magnetic; if you slide a screwdriver through one of the indentations on the outside, it demagnetizes it. This is very important when you're doing video adjustments, for example if the screwdriver's magnetized, and you bring it near the CRT, it will distort the video, making adjustments very difficult. Extremely handy for working in small spaces or connecting things that are out of sight. But an everyday makeup mirror will do in a pinch too. Try to find one that's encased in plastic or rubber so it's less likely to short things out or break when you drop it. It's a small pair of alligator-style clips, mounted on a small iron base, and the clips are on the ends of little metal arms with ball joints so they can articulate quite freely. Sometimes there's a magnifying glass mounted on there too. I thought these looked stupid when I first saw them, but they really are great, especially when you're trying to solder a couple of wires together and you need both hands for the iron and solder. I've used that WAY more than the voltmeter setting.

If you want to know if a battery's any good, you can take a Christmas light and some spare wire and get some idea that way or, one of those little pocket testers. But a decent multimeter can be very handy. Keep in mind that many computer power supplies will read nothing unless they're under load; in other words, you might plug it in, flip the switch, put your probes on one of the power connectors, and read nothing, because your multimeter isn't drawing enough current to draw current. Or something. Electricity is bizarre. If you search around, you can still find those old floppy head cleaning kits, which are basically a floppy with a cleaning pad where the actual data disc would be. You drip their cleaning solution rubbing alcohol on the pad and shove it in the drive, it makes a terrifying sound, and the heads are clean. You can put Scotch tape over the top for 400k drives because those only have a head on the bottom, and where the top head would be, there's a small cloth pad a cleaning floppy will tear this off!. Take some lubricant such as a Teflon lube pen Radio Shack or even 3in1 oil NOT WD40, and drip it sparingly on all the moving parts. Repeatedly insert and eject the diskette until the action smoothes out. Sometimes you can stop the cooling fan stick something through the slots, THEN turn on the machine, and listen closely; if you can't hear the hard disk spinning up, or if it's making a clickclick sound, then its internal lube may be sticky. There's no safe way to take apart a hard disk unless you've got a clean room, but you can often get the drive to spin up at least one more time by doing the following. If the computer is small e.g. a Mac SE, turn it off and unplug it, and pick it up with one hand in the handle slot and the other hand underneath the machine. With your upper hand, carefully but briskly give the machine a partial twist, like a spinning top motion, several times. Do this over a couch or other cushioned surface in case you drop the Mac.

Rinse, lather, repeat until it works or until you get sore. If you can do basic soldering, take the case apart and remove the plastic shield on the upright power supply. Locate the circular ring of solder points near the center of the upright power board; this is where the flyback transformer is connected to the board. Look closely, with a bright light and magnifying glass, at each solder point; if you see any tiny hairline cracks in the solder, then heat and remove the old solder and replace it

with new, and try firing up the machine again. More likely than not, your problem will be solved. You can obtain replacement caps very cheaply from Radio Shack or other electronics suppliers just match the info printed on the old cap, desolder and replace. Make sure you note the polarity and get it right on the replacement, it does matter with electrolytic capacitors though not with ceramic ones. You will need a set of TV repair tools Radio Shack, which are a cheap set of small plastic screwdrivers and hex drivers about the same size as Jewelers screwdrivers, BUT they are made entirely of plastic. Turn up the front panel brightness control to the max before you touch anything, then adjust the internal brightness control so that the outermost visible edge of the screen is just barely black or until there are no visible diagonal scan lines. Then fiddle with the other adjustments til youre happy. Obviously, the machine will need to be on while you do this, so you can see the screen. keep one hand behind your back and use only plastic tools, and you will be safe. Now it gets dangerous. That yoke described above. If you look carefully, you will notice a series of small plastic squares around the CRT neck. Each of those is actually a little plastic bolt, and turning them will affect the characteristics of the ray gun.

Again, you cant do this effectively with metal tools for the reasons mentioned above, and unless you have small children with FisherPrice tool sets, you probably dont have a plastic wrench or pliers, so you have to do it with your fingers. Maybe rubber gloves would help keep you safe, I honestly dont know. The best part is, you have to look AWAY from your hands to see how the screen looks, which increases the chances that you will bump the scary copper wires in the yoke. The pros recommend using a mirror so that you dont have to be reaching behind the screen while looking at the front. I never did that, I was just very careful and slow and sweaty. The plastic bolts wont help you there. Look at the narrowest part of the yoke; you will see a thin metal collar going around the skinniest part of the tube, with what looks like and probably is some kind of white cloth lining between the metal collar and the glass tube. There is a screw in the collar, its just like a hose clamp. If you loosen it slightly, and VERY VERY GENTLY twist the whole yoke, you will change the orientation of the tilt. Then, VERY VERY GENTLY retighten the screw JUST TO WHERE IT WAS BEFORE YOU BEGAN. Take breaks, let your muscles recover, lighten up on the coffee, have a friend present who can help if you get hurt, etc. This IS dangerous. Its even more dangerous doing these sorts of adjustments on big TVs and computer monitors, because the bigger they are, the more voltage they carry, and it doesnt take much to stop your heart. The website looks pretty whack, and I cannot vouch for the veracity of any of their products, but this is the first source Ive ever seen that at least in theory provides that sort of thing. Thanks to Steve C. for the lead! Go here and scroll down to see all Apple related articles on the site. Thanks, Jim! Sorry it took me so long to add this link.
